1662. Re: How do you create an extended format using the system calls?

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 15:28:34 UTC
From: bpat@cs.mcgill.ca
Message-ID: <1992Feb19.152834.29081@cs.mcgill.ca>
Source record: 225459
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

You can use the OS calls to create extended format disks without problems, no matter what others may say :-)
I've written my extended formatter & copier using only "Official" calls i.e. those accepted by Atari. Simply call flpformat() (or something like that) with 10 as the number of sectors per track. (And even 80+ as track number) Sure its not as fast as if you had made your own routine, but you are GUARANTEED that it will work on ANY ST, STe or TT.

Everybody is always complaining that Atari makes bad computers which are not all compatible. But if you people had the sense of building your programs only with what is given by Atari, you wouldn't have these problems. and the OS is fast enough even for games. Of course, if you don;t optimize the way you place the calls to GEM, it will be awfully slow, but with some efforts it is possible to create fast, efficient code with TOS & GEM alone.

>hold of him?

I don't know if there are lot of programmers in the history of Atari
software development named Frank Cohen. If you're the one who wrote
all those great platform games for the Atari 800 (Ollie's Follies, Ghost
Chaser, Cohen's Tower, Beer Belly Burt's Brew Biz etc) it's nice to hear
you've been busy doing something for the ST as well.

If you're not, it's nice to know that there have been at least two guys
named Frank Cohen writing Atari software.

I still remember the passwords for Ollie's Follies levels.

1664. PC/NFS via SLIP for 1040st

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 16:05:51 UTC
From: roddy@sbil.co.uk
Message-ID: <1992Feb19.160551.4091@sbil.co.uk>
Source record: 225463

Hi there,

I am in the process of trying to install the KA9Q package on an atari
to get SL/IP running between a SUN SparcStation IPX and a 1040st. I am
primarily interested in backing up my Atari via the link, although the
IP link will be useful in many ways. I have 2 queries:

1) has anyone already implemented a backup program for the atari which
runs across an SL/IP link to some sort of unix-like machine

2) has anyone got PC/NFS running on an atari across the KA9Q SL/IP link
to a SUN server.

Hopeful, I know, but there are some crazy people out there...

In the (unlikely) event of much interest in this, I will summarise to
the net.

Roddy Manzie

1665. Reading / printing TEX files?

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 16:18:17 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Feb19.161817.13505@a.cs.okstate.edu>
Source record: 225462

Is there a simple way to read TEX files? I'm accustomed to ascii doc files... and need an easy way for the end-user with a minimal ST system to read documentation.

If there's not a way for the single floppy user to read TEX... Could folks put ASCII text type documentation in with their TEX files? This could be generated by printing (ASCII) to a file using whatever tex utilities the document author uses.

jc cummins@a.cs.okstate.edu

1666. Re: Send me your assembly code!

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 16:35:14 UTC
From: paul@kagaku.se.fujitsu.co.jp
Message-ID: <PAUL.92Feb19163514@nsx.kagaku.se.fujitsu.co.jp>
Source record: 225480

VERY GOOD!!! THIS IS MORE LIKE IT!!!

Me and my friends have started a demo crew about six moths ago, and we are currently very busy writing lots of assembly code! I also have loads code from other demo crews for lots of ST topics. I would say that I now know the ST and STe computers *almost* inside out, top to bottom, and back to front as far as assembly coding goes. (All demo coders are big-heads by the way)! So if you want some help about any of the following just write me:

No bottom border (easy)
No top border (harder)
No side borders (even harder)
Sync scrolling (hardest)
Writing mod players

in fact, bugger this, I'd be glad to discuss any assembley topics, especially interesting ones involving neat tricks.

For example, did you know you can use the MOVEP instruction to get a fast byte scroller, or how to use the fact that move.b #1,(a7)+ adds 2 to a7 instead of 1 as it would to any other address register. This helped me write an ultimately quick STe sample replay routine for example.

BY THE WAY, WE ARE LOOKING FOR NEW MEMBERS FOR OUR DEMO CREW. If anyone is interested, here's a brief description (I hope you don't mind if it sounds like I'm bragging. Nobody wants to join a shit demo, do they?!).

We have 3 definite members, currently.

1 is a 16 year old coder. He started coding at 9 years old, started machine code at 12, and sold his first game at 15. For 16, he's shit hot. He's pretty good at graphics, the best among us, but still far short of what's needed.

I am 20 years old, started coding at 11 years old, machine code at 13, sold first game at 15. I'm currently doing a year out of uni, in Japan (working in AI). I code on the STe at night after work. I write the music for our crew, and I am good enough, but I always find that music is better when co-written.

The last guy is 23, and is about equal good coder as me. He's already written loads of demos with a different crew, but is pissed off that no-one else in that crew can write good code. He's currently working in Luxembourg.

This summer, we also had a 19 year old Amiga coder who's real smart, but relatively inexperienced. He was converting the STe game I'm writing to the Amiga. We aren't sure if he wants to keep going. (I haven't been in touch with him since - He's currently spending his year out of uni in Finland)

We are currently working on several games, a new tracker, and a huge megademo. We will give the megademo out for free, doing everything in our power to make it spread quickly. We will attempt to market the games, and tracker ourselves.

So what we need most is a really good graphics man, but really good coders and really good sound men are also welcome. Anybody that's interested, or anyone that wants coding help can write to me:

Paul Donnelly,
Room 328,
Fujitsu Unoki Dormitory,
Unoki 2-17-18,

In article <9017@tamsun.tamu.edu> n160ao@tamuts.tamu.edu (Mark Lehmann) writes:
>The only thing I can't get to work it piping. I always get a
>out of memory error when I pipe something as simple as this in the
>Korn Shell.

> ls -l | grep ttp

It is unlikely that ls or grep are internal commands, so I don't think
that's the problem. I suspect that the shell starts both ls and grep at
almost the same instant, and the result is that the first one started
hasn't had time to call Mshrink. Thus the second Pexec fails because there
isn't any free memory. This diagnosis works even if both ls and grep do
eventually call Mshrink.

The solution, as was pointed out, is to use ulimit or the equivalent. If
you limit each program to 1/2 the available memory in the system, you will
be able to start both of them simultaneously, even though both Pexec's
happen before either one does an Mshrink.

Cross-posted to: comp.sys.atari.st,misc.forsale.computers,misc.forsale

Greetings. I am currently in the process of upgrading my Atari 1040ST and thus have a large number of books that I would like to sell. The prices I have listed are suggestions; if I find a huge response I'll sell them to the highest bidder, but if response is nominal, I will sell them to whoever offered to buy them first. All prices are without shipping. If anyone is interested in the entire set, we'll see if we can negotiate a better deal. All of these books are in PERFECT shape as I am a self-avowed bibliophile that even goes so far as to wash my hands before opening a book :-)

Please send all offers and questions to: malek@screamer.csee.usf.edu
If that address doesn't work try malek@sol.csee.usf.edu or malek@sunrise.ec.usf.edu

Thank You.

Abacus Books:

Vol 0: Presenting the Atari ST
Vol 2: Atari ST Internals
Vol 3: Atari ST GEM Programmer's Reference
Vol 4: Atari ST Machine Language
Vol 5: Atari ST Tricks & Tips
Vol 6: Atari ST Graphics & Sound
Vol 7: Atari ST LOGO User's Guide
Vol 10: Atari ST Introduction to MIDI Programming
Vol 12: Atari ST 3-D Graphics
Vol 13: ST Disk Drives: Inside & Out

Asking $75 for the whole set.

Compute! Books:

Learning C Programming Graphics on the Amiga and Atari ST ($15)

Compute!'s Technical Reference Guides ($30 for both)
-Vol 1: Atari ST:VDI
-Vol 2: Atari ST:AES

Atari ST Application Programming ($20)

I also have for sale :

Atari ST StereoTek Three Dimensional Glasses
& the following 3-D software (works with the glasses)

-Genesis: The Stereo Molecular Modeler
-Shoot the Moon (3D arcade game)
-Cyberstudio CAD 3D 2.0

I would prefer to sell all of these as a package, but I will entertain all
reasonable requests.

1669. Wanted: GEM .IMG to something-else converter that works!

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 19:11:05 UTC
From: mathew@mantis.co.uk
Message-ID: <7goegB1w164w@mantis.co.uk>
Source record: 225477
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc.misc

I'm looking for something which will read standard GEM .IMG files with palette entries, and write something else. Say, .GIF. Ideally with the same palette as the original file, but I'll settle for doing some re-colouring if there's no alternative.

I've already got GWS 6.1, and it doesn't read .IMG files properly. (Someone didn't read the DR specification properly, eh?)

I don't have FTP, so browsing FTP sites hunting for likely files would take me ages. If you have a .IMG to something-else conversion program which you know works with .IMG files with palette entries, PLEASE at least mail me and tell me the name of it and where you got it from. I don't mind if it runs on ST or PC.

Replies by mail please. Thanks.

mathew

My Oakland phone book shows a phone number of (510)547-2191. They have responded to me via email in response to a posting on the net, so they may do the same for you.

It should be very simple to attach a second drive - like any other SCSI device, just plug it in further down the cable, and make sure only the last device on the cable is terminated (resistor packs on the circuit board of the drive typically near where the cable plugs in). Also be sure the drive is jumpered to a different address.

I had a brief look at it. The performance of a simple 'ls' in a MGR window gave me the kick. If you like chatting, drinking coffee and reading a book while you do computer work, MGR is your solution. If you think that a TT should at least show some speed, delete MGR*.* as soon as you can.

Very simple, get the append program that is here on A.A. and was
posted to binaries, then just use UUCODE10 program that is also on A.A.

I find this is the way to go, no cutting required and so far no failers...

1679. Attaching SCSI drives

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 01:52:52 UTC
From: jmw@lad.med.utas.edu.au
Message-ID: <jmw.698550772@lad>
Source record: 225475

I am contemplating adding an extra hard disk to my 1040STf, TOS 1.4, 2.5Mb internal, SH205 (?) 20Mb Atari Hard Drive. Could I ask, what is involved with adding a SCSI drive? What adapter(s) and software will I need, and will it be compatible with my existing Atari drive.

Thanks in advance,
--

1680. 68010 in a STE?!

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 02:28:45 UTC
From: gverrill@engws9.ic.sunysb.edu
Message-ID: <1992Feb20.022845.19698@sbcs.sunysb.edu>
Source record: 225478

Hello everyone!

For those of you wondering how to install a 68010 in a STE, how about trying one of the STE installation adapters for the Turbo/16/20/25 from Fast Technologies? This provides simple plug-in installation of a rectangular 68000 into a square STE socket. I don't know if this will work, but it seems fairly straight forward, as long as a 68010 is pin compatible with a standard 68000. If anyone has any luck with this please send me E-mail and let me know how it goes. Good luck!

-Michael Rose

p.s. I am using a friends account!

1681. Re: >>>READ THIS DEATH OF ATARI.ARCHIVE.UMICH.EDU<<<

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 02:32:20 UTC
From: dhollis@bitsink.uucp

Source record: 225524

Regarding the imminent death of atari.archive, I think this
calls for some serious discussion. Maybe we can find a
new home for the archives, preferably some site that
can run a mailserver (as I don't have ftp access yet :)

The main problem would then be moving the bulk of the
archives to the new site. Hopefully it won't be a site
in europe where people would have to go halfway around the
world to get binaries, but if there is no other alternative....

Anyone have any other ideas? We need a solution quickly!

Actually, the administration's idea of shutting down a.a
quickly becomes invalid if a.a were to run completely under
volunteer power. Maybe we can convince them that this
is the route to take?

FOR SALE :

- Atari 1040 ST

* 1 Megabyte RAM
* 1 Internal Double-Sided 720K drive
* Tos 1.4
* SF314 External DS drive
* SC1224 Color Monitor
* Mouse, mousepad, disk holders, cables, etc.

- This computer comes with all of my disks and games.. I have approximately
100 disks. Among this collection : GFA Basic 3.0, Flight Simulator,
OCP Art Studio, Word Writer, Compute's Second Book of Atari ST,
Interlink 1.85, Masterlink 1.0, Publishing Partner, assorted manuals,
and the book ST Disk Drives Inside & Out.

Asking $400 Or best offer.

Email me if you live out of the dallas/fort worth area. Above does not
include shipping.

Otherwise, if you live in dallas, please call Corey at 214-298-1746, especially
during the hours past 3pm, especially on Tuesdays and Thursdays.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a question about FSM GDOS that I can't get answered anywhere.
Can anyone help?

What I want to know is this: Is there, or will there be, a FSM GDOS Font Maker tool available? Perhaps for sale, perhaps for an extra price, perhaps just a utility to convert Calamus/PageStream fonts to FSM GDOS format?

If such a beast is not available, are there plans to market such a thing? I'd love to tinker with some fonts again...

Please reply by e-mail. Thanks in advance.

1685. Accelerators for the ST forsale

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 06:49:58 UTC
From: stevef@bug.UUCP
Message-ID: <939@bug.UUCP>
Source record: 225483
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have come to possess a large number of Processor Accelerators for the 520, 1040, and Mega ST that I will sell for $65 each shipping included (add $5 for shipping outside the U.S.). I will sell two for $100. These are new units, in the box, were built by CMI and are fully tested. These accelerators are on multilayer boards that plug into a socket you solder onto the 68000. These boards are built around a 16 MHz 68000 and run at double the standard processor speed. The speed up you get with this product depends on the software you are running, but it runs from 10 to 30%.

These boards (there is a different one for the 520/Mega or 1040, so let me know what you want) also accept 68881 floating point unit of any speed, although it doesn't pay to get one faster than 16 MHz. For software that uses the math chip you can get speed ups of eight to ten times or more.

There is also a socket for an Atari blitter chip if your machine didn't come with one. You can get these from your Atari dealer.

These boards originally sold for around $300. Schematics and PAL equations are available on request (they are available separately along with a blank board for $15). Complete instructions are included. DON'T try to install one of these if you are not handy with a soldering iron and haven't done this kind of thing before! I will not be liable for your mistakes.

As someone who got the schematics pointed out (thanks Keith Petley <kp@crosfield.co.uk>), there were a couple of designs flaws in the boards I was selling that could in some cases affect some users. However, these are easy to fix and I have corrected the boards I'm selling now. If you bought one of these before (either from me or from CMI), and are having trouble, let me know and I will let you know how to fix it.

If you want one of these, call or send a check to:

1686. GULAM: for users or programmers?

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 07:56:44 UTC
From: rkallen@msb.com
Message-ID: <1992Feb20.075644.2657@msb.com>
Source record: 225486

I've looked through a documentation file for GULAM & found
it difficult to understand. The program appears to be very much
oriented toward programmers or people with that inclination.

Is there a shell for GULAM oriented toward "users"?

* * *

Also, what makes GULAM preferable to other (MS-DOS type)
cli's for the ST?

1687. LHARC problem

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 07:59:20 UTC
From: rkallen@msb.com
Message-ID: <1992Feb20.075920.2748@msb.com>
Source record: 225485

I'm having a problem with DIRECTORIES using LHARC to create
an lzh archive file:

If I give a path (i.e., drive/directory spec.) that begins
with the root directory (i.e., the drive spec) to the target
filename (i.e., the name for the lzhfile to be created from the
source file(s)), LHARC starts compressing the *entire root
directory*.

e.g., with PALMTOPS.INF (shown in lowercase below to set
it off from the lzh archive to be created) in the same directory
as LHARC, the following works okay:

LHARC.TTP a PALMTOPS.LZH palmtops.inf

(i.e., PALMTOPS.LZH is created from palmtops.inf)

. . . *but* the following -- with PALMTOPS.INF in a remote
directory (from LHARC) -- does *NOT* work:

LHARC.TTP a PALMTOPS.LZH h:\save\palmtops.inf

(i.e., my intention is to create lzhfile called "PALMTOPS.LZH"
from the file named "palmtops.inf" in the "h:\save\" directory.

*** In the latter case, LHARC starts compressing _all_ of the
files on H:\ (i.e., in the root directory) in order to create
"PALMTOPS.LZH". ***

Stranger yet:

When I noticed that my entire root directory was being
lzh'd I aborted. Thereafter, when I checked the
"palmtops.inf" file, I found that it contained a 'report' of
the lzhfile creation process up to the point I aborted --
instead of the original material contained in that file !!!

*** In other words, the file I'd intended to create an lzh
archive file from had been overwritten with this LHARC
"progress report". ***

Anyone have any idea what went on here?

Thanks.

CG> Christ, thats wonderful. If Atari would spend less money on corporate
CG> lawyers, and more on making machines everyone wants, we wouldn't need
CG> people like Dave Small to fix thier junk they make.
Well for one thing if Atari wins... (Atari computer IS a different entity from Atari Games. Atari Games being the video game company and has nothing to do with the same Atari that makes home video games and the like.)
...If Atari wins the $160,000,000 will go a LONG ways towards improving lots of stuff at atari.. Remember that atari is currenlty only worth $400,000,000 or atleast they were at the time of the federated ordeal. They may be worth less now... Also recall that the + means that atari doesnt pay for their lawyers if atari wins. Nintendo pays all of ataris fees plus all the court costs plus their own lawers.... Nintendo could get hit hard.. But since the owner is worth alot more then $160,000,000 he could prob

ly care less since he is something like one of the 10 richest men in the world or something.

Just think if atari got tripple the requested amount then they would essentially get enough money to just about double their operation..
Also recall that last year atari supposedly spent 16million on advertising altogether. Now that federated is gone, if they beat nintendo it could be enough to get atari back in the game for quite a while.
Ataris aren't junk, but the companies "brains" are idiots...
Just my personal opinion...
The computers they make are the best out there over all..

MF> borres@aix.rpi.edu (Steven D. Borrelli) writes:

> Atari is suing Nintendo for $160 mil for Antitrust
> violations. If they win,
> judgement is tripled.

MF> What exactly is meant by anti-trust violations?

It means that it is illegal to build a monopoly in the US unfairly.
If a company does specific things to try and become the ONLY company in a certain area without the gov't permission then another company that is trying to make it but can not due to shady bussiness transactions by another company
can sue the other company for damages and to make them more honest..
Simular to what the US auto makers are blaming the Japaneese auto makers of..
Nintendo has a priporitary (sp?) chip that is meant as a lock out chip.
They put out a patent on this chip and no one else was supposed to be able to
use it. This meant that if you were able to clone it nintendo tried to shut them off..
This lawsuit is probly an offshoot of an earlier lawsuit nintendo placed against atari.
Atari Games had cloned the chip and produced games for the nintendo. Nintendo used the basis of their patent to try and make atari stop selling these games. Last I heard nintendo lost that. Since atari was placed with a Cease and desist order until after the case atari probly is suing for lost income...

Ps, I believe the lawsuit probly is with atari games and not atari computers..
The difference being warner still owns atari games and it is not associated with atari computers anymore at all....
Although atari games still sells game systems such as the lynx...
Are you confused yet? :)

|possibility of having bad ram chips ?>
|
|Is it second hand? If it is then it may have had a memory upgrade
|which was removed before selling.

Perhaps I should tell my experience here: I bought my ST (a 520 ST+,
that's a 1 meg machine) way back in 1985. Well, at first you don't do
anything BIG; but, after about half a year I found out that only 1/2 M
was working. And the guarantee period was expired, so I had to _buy_
the memory that was rightfully mine.

Talking about gripes, that was not the only problem I've encountered.
The cable they gave me for the display (an Ancona colour monitor)
wasn't correct - had to buy a new one. That monitor broke down after a
few years, had to be repaired. The hard drive - a standard SH204 -
costed an awful lot of money: some Hfl. 1500.-, an amount of money for
which you can buy yourself a nice AT _with_ harddisk nowadays.

But soon these worries will be over: I'm planning to buy myself a NeXT;
this machine is more closely fitted to my needs and expectations (I'm a
professional programmer, and work with Sun's, Pyramid and Ultrix all
day).

Cheers,
Leo.

>"""

There's no such thing as 'ASM-GDOS'. What exists is 'AMCGDOS', a
german GDOS clone. The last freeware version was 3.x. Newer versions
(> 5.0) have GEM/3 Bezier curves.

FSMGDOS is the new Atari GDOS with outline fonts and Bezier curves and
should be shipping right now :-)

The problem is that the original release of Stunt Car Racer was not
STE-compatible (remember, it's getting old). Contact Microprose/Microstyle
for an updated STE-compatible version (all copies now sold in the UK are
STE-compatible).

Atari now has a 1 year warranty, but why not just get the monitor Fixed,
would that not be cheaper, also Atari does have this repair exchage thing,
far cheaper than a new monitor I would think..??

Yes, there is a way. Simply distribute the ATARI SCREEN DRIVER (smmono.ttp or dvimono.ttp I`m not sure how it is called) with your TEX file (.DVI file!).

They are a sort of raw VDI format -- they're called Metafiles. You'll need something like EasyDraw, HyperDraw or any decent DTP program to view them. Essentially, a metafile is a recording of the VDI commands used to draw the image.

int D(){ return (1 + 0xE); }
};
```

```
bug.cc: In method int X::D ():
bug.cc:4: floating constant exponent has no digits
bug.cc:4: parse error at end of input
```

```
struct X
{
E(){}
int D(){ return (1 + 0x7); }
};
bug.cc: In method int X::D ():
bug.cc:4: parse error at end of input
```

It seems to be a pretty weird bug:

1. It only happens if the E() method is there.
2. It only happens inside structs (or classes).
3. It happens with or without the ()'s around the expression.

Might as well buy a muliti-sync and swx box(or make one) so you can get
both color and mono. You can get a name brand like Sony,Princeton,NEC etc.

1698. Atari SVR4

Newsgroup: comp.sys.atari.st
Date: 1992-02-20 13:37:11 UTC
From: md91jbj@brunel.ac.uk
Message-ID: <3578@mercury.brunel.ac.uk>
Source record: 225498

There was quite a lot of discussion regards Atari's SVR4 port on this group a few months back, but it all seems to have died down. I've been thinking about getting a new machine to run SVR4 on and the TT is the obvious choice since I dont have to trash all the software I already have. But although the TT is available in the UK I haven't seen any mention of SVR4.

Has SVR4 been released, or is it beta testing, or developers only? If it doesn't show soon I may have to resort to a PC (argh!) + Solaris... Someone save me from this grizzly fate and tell me where I could get a copy from (and how much its gonna cost :-)

I've had a 1040 STe for a few months now. Previously I had a 520 ST. When I first got the STe I noticed the two additional joystick-size ports on the left side of the machine. I thought they were 2 additional joystick/mouse ports. In fact I think I remember reading a review of the STe a while ago which stated the STe had 2 additional joystick ports. Last night I inspected these ports more closely and they're not joystick ports at all (at least not the joystick ports that I am used to). They're 15 pin female ports. What are they for?

Probably a bug in the library used to compile it. Some very early versions
of dlibs had a bug in memcpy that occasionally stepped on strange memory
locations. The startup code calls memcpy.

Solution: Recompile uud/uue (Sozobon 1.33i works fine), or find a copy
that's been compiled with a newer library, or use UUCODER.PRG.

>Heh.. even if they were going to insult Atari due to insecurity or nightmares
>or something.. couldn't they atleast find a more creative way?? Sigh..

First, not everyone on the usenet is in college. Many people forget this.
Corporations, and private services such as genie, compuserve, fido-net, etc..
all have access as well. Then there are people (like me) that maintain their
own private site.

Second, If you had read the first message, and not just the flame about it,
you'd know that it came from an Atari user that was sick of Atari's bullshit.
NOT from an Amiga person. I think you people like to jump to conclusions too
much, which is a much bigger sign of insecurity.

It's generally a shot-in-the-dark method if it isn't labled on the
SCSI drive's logic board (usually I1,I2,I3 or E1, E2, E3). Look for any set
of jumpers, especially if there are only three.

Seagate loves to put jumpers on their boards and not label them. On
the ST-138N, the set of jumpers (5 sets) that are located next to the SCSI con-
nector (and point in the same direction) are the SCSI select pins. The three
outside pin sets of the five are the SCSI select lines, while the first inner
pin set (closest to the SCSI connector) is a line for an external LED disk
indicator. This is a pretty common setup for Seagate drives.

Erik> irrational expectations) I don't think you spent enough time on
Erik> .advocacy to sort through the garbage.

Yep. The group was created as a forum for people to complain or post
rumors or flame something they don't like or debate other computer
systems. Drawing conclusions about the Amiga from the posts in advocacy
is similar to going to an unemployment line to ask people about the
economy or hanging around a manufacturer's complaint dept to ask about
their products and then expecting to get an objective overall viewpoint.

> Perhaps this can lend a bit of insight into the reason that the
>amiga folk often post over here. They read comp.sys.amiga.advocacy, get

Erik> This assesment is totally preposterous.

Almost to the point of being comical.

Erik> <description of how someone could easily get the wrong impression
Erik> from c.s.a.st deleted>

Erik> Here is the basic reason there are so many flames to c.s.a.st:
Erik> <good analysis of things that frustate Amiga owners deleted...>
Erik> Just suffice it to say that the flames you see are merely the
Erik> result of frustration, not jeolousy or anything like that.

I agree, this seems like a *much* more plausible theory than jealousy.
FWIW, the reason I personally read the ST newsgroups on occaision is
that I used to own one (which I sold to buy an Amiga 3000) and I'm still
interested in what's going on in the Atari world. The ST is not a bad
machine and I typically do not flame it. I also think that the majority
of Amiga owners are not hotheads but that there is obviously a very
vocal minority of immature users.

Erik> I'm sure many st people have experience equal frustration in the
Erik> past, it's just that there aren't enough st advocates out there.
Erik> most st users have come to the realization (long ago) that Atari
Erik> may never go anywhere, not to say it won't, just that many st
Erik> users don't want to get high hopes, after being let down so much.

Yup. I know felt that way when I owned one.

I think the ST user community is a very cool group of people, in
general. There is definitely a very supportive and friendly atmosphere
toward other Atari users. There are also many talented ST hackers, look
at Hacman, Opus, MiNT, GCC, Gemini, et al. I wish Opus ran on the Amiga.
(Is source code for Opus available, BTW? ;-)).
The Amiga user community is very similar, you just wouldn't know it by
reading advocacy or the flames some of the idiots post here.

It's too bad there isn't more cooperation between the ST users and Amiga
users, because both groups face similar problems ("nonstandard"
computing platform, "toy" image in public eye, manufacturer doesn't know
how to market machine properly, uneducated computer buyers ignore
machine because they haven't heard of it or don't understand it, etc).

I'd like to see some joint software development or some GEM<->Intuition
libraries for porting stuff rather than flame wars. Everyone would
benefit in the end. (Send e-mail if you have comments on this idea!)

Erik> Anyways, don't flame me for posting it here, as it was an Atari
user that
Erik> originally posted this, i'm merely giving my opinions.

ditto.

There was available somewhere on the net (I have a copy too), of
a thing called pmfs (poor man's file system) that used a file on
a unix box to emulate an atari file system. The connection is
232. You just have an icon on the desktop that is the unix box.
Your software doesn't know where it is. It is a tad slow, but
surely no worse than slip.

Ok, here's the stuff for E. Arthur Brown:

E. Arthur Brown Company
3404 Pawnee Drive
Alexandria, MN 56308
1-800-322-4405 (order line)
612/762-8847 (other stuff)

* They're open Mon-Fri 8:30 AM - 4:30 PM CST

This is a really great company , I 've bought lots of stuff from them
with good service and efficiency, they seem to know about the products too.
Also their new catalog has a lot of the newer stuff for great prices, like
Mega STe, Syquest 44, Supra drives, all sorts of neat stuff, give them a call!

Disclaimer : No I am not associated with them , they're just a great Atari
supporter. :-)

I have the following ST stuff to sell:

1040STf (internal floppy drive is apparently crapping out)
Monochrome Monitor
Spectre GCR
Hard drive interface (I think I'm going to keep the hard drive)
and some misc software including the EZTRACK MIDI sequencer

Please send offers or inquiries to:
Chris Merz
509 Berkeley Rd #104
Irvine, CA 92715

According to Znet, CodeHead is supplying Icon Juggler with their TOS
Extension card.
For those of us with TOS 2.?, will they give/share/sell Icon Juggler
separately? If so, what does it cost?

I got a file from atari.archive a while ago that describes, with pin-outs, how to do this. It's called something like 4_JOY.LZH or .ARC.

BTW, I'm still looking for Calamus if anyone has a copy for sale. One person from Sunnyvale replied, to which I responded, but I haven't received another reply yet.

1723. yet another DATABASE enquiry

Newsgroup: comp.sys.atari.st
Date: 1992-02-21 01:15:47 UTC
From: swanee@megadata.uucp
Message-ID: <1992Feb21.011547.8788@megadata.uucp>
Source record: 225512

Greetings all,
I am currently looking around at databases and would
like to know if anyone out there knows of a good database that I
may be able to get over here downunder. I've been playing around with
Superbase for a while but it is very slow when performing a query on
a reasonable sized database. I've heard 'Phoenix' mentioned but I
know nothing about it, let alone its availability over here.

BTW, I've been trying to do part field matches in Superbase (i.e.
matching a text string with a part of a field) and all it seems to
want to do is match the string to the entire field. This is pretty
useless if you have a 'keywords' field and want a match with only one
keyword from this field. Perhaps I'm just not using it correctly (more
likely). Any clues or advice would be appreciated.

Thanks in advance,

Sla/n go fo/ill,
Risky B.

1724. Gauntlet 2 on an STe

Newsgroup: comp.sys.atari.st
Date: 1992-02-21 02:01:39 UTC
From: mlake@irscscm.UUCP
Message-ID: <1992Feb21.020139.3874@irscscm.UUCP>
Source record: 225615

Has anyone tried to play Gauntlet 2 on an STe? I just acquired it recently and my copy boots fine but it automagically creates a player 4 before it begins game play. The player 4 shoots constantly and can't be controlled (at least as far as I've tried). This makes the game unplayable even though you can create other players. Does anyone know of a fix for Gauntlet 2 on the STe? Or maybe my copy is screwed?

>2.01e that was fixed in later versions?

Sounds like one of two problems I've had with 2.01x versions. One, you might be running out of memory. It does weird things if memory runs low. Two, if they were -lh1- (v1.xxx type) LZHs created on a Unix system or some other system that allows lower case, then Quester's 2.01x won't see the files. Its blind to lower case files. It will still extract any and all files if you give it either a *.* or no wildcard (defaults to *.*), you just can't extract them individually. Sometimes there is only one file in the .LZH, like with some GEnie Lamp press release files, and you can just use a wildcard to view them. Otherwise, best to unLZH it and reLZH it I would say. If thats not it, I don't know. Maybe get a newer version, its up to at least 2.01i and maybe higher by now. Mark...

Thats one of the most reasonable posts on the subject I've seen in a good
while, and exactly how I feel about it. I sure wish the people engaged in
arguements about which computer is the most worthless and should be hauled away
by the trash truck the fastest - I wish they would read that post and wake up.
But I've noticed that most of the guys who engage in that sort of BS don't
really bother reading messages anyway. They only look for material to fuel the
flames and let the rest go. But one can always hope. Anyway, I generally stay
away from commenting on the flames, it usually just makes it worse. Better to
let them die, if they will. But I had to comment on the positive, cooperative
tone of that post. Thats something I would like to see a lot more of....

>bug.cc:4: numeric constant contains digits beyond the radix
```

The compilier doesn't like the empty braces you've defined for the
function E. I'm not sure why you'd want to have empty braces, but
if you're looking for a pure virtual fiction, the proper syntax is:

```
struct X
{
void E(void) = 0;
int D() { return (1 + 0x8); }
};
```

If you're just defining E() as a class member, then try:

```
struct X
{
void E(void);
int D() { return (1 + 0x8); }
};
```

I tried these and both work fine. The hexadecimal constants had nothing
to do with your error.

The way I would sugest you go would be ICD as they have good support
and there software is kept up to date, they also post updates to GEnie.

You should have no problems with your SH205 as long as you can change
the DMA address to other than zero so that the ICD device boots up first,
and use the ICD software to run the hard drives..

Probably the reason you have not heard much about it is that you haven't been looking in the right place(s). My advice to you, and to others out there in this newsgroup, is if you want to know what's going on with Atari, subscribe to an Atari magazine, or subscribe to the Z*Net on-line magazine. You can get Z*Net by e-mail. Just mail to stzmagazine-request@virginia.edu. In the body of the message say that you would like to be added to the mailing list, and include your e-mail address where you would like to receive it at. You can also get current or old Z*Net issues at atari.archive, under atari/magazines/znet. Fortunately I print out the issues of Z*Net that contain product announcements and other exciting news. One of the times that the ST Book announcement was printed was in issue #9110 of Z*Net. Look for this issue on atari.archive and download it. It has the initial specs in it. Some of the specs have been changed since that announcement, but it'll give you a general idea. The issue numbers are in the filenames of the issues on atari.archive. So issue #9110, will be called "znet9110.Z", or "znet9110.txt.Z" there.

If you are looking for a specific Atari magazine to subscribe to, I might be able to find the information for you as far as mailing address and subscription rate.

They are for joysticks! :)
No, really, they are. You may attach two joysticks to each of the ports and they also allow paddle use. For the pin-out you should ask someone from Atari or look it up in a GOOD book (I would recommend Julian Reschke's "Atari ST/STe/TT Profibuch", but I am not sure if it is available in English...yet.)

Actually, I tried all the -fxxx compiler options, but I did not get any better results. It seems that -O includes all these... (sorry, I was still too lazy to read the whole gcc.man file...)
When I used -mshort the program wouldn't run, it crashed... (must be my library!).
BTW, the benchmark source used was v2.0, unmodified.

>
>
> Alexander Minidis

This solution will fall short because the DVI driver needs access to the font
(.pk) files at run-time. It would be impractical to cater for all the fonts
that may be used by a document just so that someone could print it out.

A better solution is for the author to distribute the TeX file for those with
TeX, and also an ASCII version. To make the ASCII version, use a \documentstyle
option [screen], format the .tex file, then put the DVI file through dvi2tty to
produce a readable ASCII text file.

Similarly, for those people with access to a PostScript printer or previewer,
dvips could be used to produce a PostScript file.

Source record: 225547

Sorry about that messed up post. (Anyone know if it's possible to cancel news shortly after you post it?)

Right, back to demo crews...

The first time I heard of demo crews was only about a year ago. It was after I saw a demo called 'Life's A Bitch' by TLB & Friends that I became a complete Atari freak. This thing was ten times more amazing than any piece of software I'd seen before. At this time, I had already written and sold machine code games for the BBC Micro, and had started assembly programming on the STe. I got *real* jealous. I just didn't know you could do things like that on the ST! A few months later, I discovered there was a guy in my class who was a demo coder. He was in "Slaytanic Cult", who have gotten several very good reviews in the british magazine, ST Format. This guy had the most amazing disk collection I've ever seen: Over 800 floppies! including about 100 disks devoted to demos. He showed me "Cuddly demos (TCB)", "Mindbomb (TLB)", "Dark Side Of The Spoon (ULM)" (The best one), and loads more. I thought: This is it! This is what I wanna do! For the next month, we had Easter holidays, so I started hacking the STe to bits. First I got some simple raster interupts going. I had no STe documentation what so ever, but just by sticking numbers into memory locations where I thought there might be registers, I worked out STe hardware scrolling with screen wrap. Next, I started working on killing borders... By the end of the Easter holidays, I had a full disk of assembly routines. I showed this to the guy from my class, and we decided we'd form a new demo crew. We started looking for other talented programmers, and got a 16 year old genius, and another guy from our class who had an Amiga. Anyway, this summer we got into it in a big way. The original plan was for us all to rent a student house, and just code day and night for three months. Unfortunately, the guy from Slaytanic Cult had to go start his university year out in Luxembourg, so there were only three of us. However, it was magic - This has to have been one time I will remember for ever. We were all in one large room. there were two atari STe's, one STFM, one Amiga, one archimedes, two video recorders, 2 large tv's, two monitors, a sampling synthesizer, huge amplifier, hi-fi... The place was a mess! We used to get up around 7 in the evening, and code all night, with music blaring from the hi-fi! We pissed the neighbours right off! Sometimes my guitarist friend would come round, and we'd jam, while the other guys played some that incredibly loud game like llamatron... Anyway, three months later, we had written two quick games, started a huge game on STe & Amiga, started a new tracker for ST/STE, wrote full ST & STe noborder code, wrote 2 ST demo screens, 1 amiga demo screen, a huffman packer, a ray-tracer (the only thing we did in basic), an ultra-quick mandlebrot

bootsector (about 3 seconds to draw an approximate mandlebrot set - cheats like hell!), an impressive logo bootsector, and a shitty virus! It's hard to describe what it was like doing all this. I guess the closest thing I can think of is rock stars. That's what we felt like. In fact, it's our aim to become really famous from writing demos & games. We want to have the image of lawless cyberpunk super-hackers, to blow the shit out of all normal games programmers, get interviews in magazines... Maybe I'll be poor for a long time, but I don't care about money, just fame. I know for one that when I finish my degree next year, there's no way I'm looking for a job, I'm gonna be a full-time hacker! DEMO CODING HAS DONE THIS WONDERFUL THING FOR ME!! I hope I've made somebody somewhere enthusiastic about becoming a hacker. It's so cool! If you read things like the disk Maggie put out by TLB (The Lost Boys), you'll find loads more people with similar feelings about demo crews... bye for now... I have to get back to shitty 'C' programming now (year out working for a Japanese company) ... At least I'm writing a packer I can convert to 68000, and use to pack our forthcoming megademo... C ya...

>and the other 2 resoultions were as you thought then shown in
>grey-scale. He told me it wasn't too hard, so it may be a solution
>for those who can't afford a Multisync or anything similar :-)

I did this mod to an SM124 and although it produced a video image, it could hardly be described as satisfactory. The "colour" modes were extremely non-linear in the horizontal direction, i.e. The same image would be almost half the width on the righthand side of the screen as it was on the lefthand side.

"Colour" mode only worked after the monitor had warmed up to full heat, during the first half-hour of operation attempts to display a "colour" picture would result in a stepped image rolling down the screen. Every once in a while it would find a slightly better sync until eventually it displayed a stable image.

Another problem introduced by the mod was fluctuating focus, in all modes but particularly bad in "mono" mode. Over many seconds the picture drifts slowly out of focus, and once in a while abruptly snaps back into focus. This does not improve after warming up to normal operating temperature. There may be other mods that work well, but I was highly disappointed with this one.

Any solutions to these problems are of course welcome, preferably by email unless there is a good reason for posting it here.

Because it will work in mono and a color won't.

Does anoyone know how to access the TT's built-in LAN port. I kind of
want to pretend to be a Mac on our campus net. Well I want to talk TCP/IP
actually but I have to do it via Appetalk (no SLIP!!!! AAAARRRRRGGGGHHHH!!!)
So how do I access the little beasty... hopefully it's just a device
number for Bconout/Bconin etc.... don't really want to bother with anything
more complicated.

Thanks in advance (hopefully),
Steve Sowerby

P.S. Ignoring the fact it's virtually vapourware by now is Spectre GCR 3.1
going to have automatica Appetalk support via the TT's LAN port?

I have a feeling there's a lot of younger people, firmly addicted to the
Atari ST, that never read usenet at all cos' they haven't come to college or
a corporation yet. At least this applies to Europe.

The Atari ST computer has been the obvious replacement for the old
C64/128, Speccy etc generation in the UK, Germany, and Scandinavia for
many years.

Among them it's mostly used for games and demo programming, but Atari
have contributed to this... culture ...more than any other manufacturer
in the 16-bit arena by providing an affordable computer. The ST has a dull
soundchip, no hardware scrolling and so on but enthusiast programmers are
getting stunning things out of it and they're still improving.

It simply isn't *bullshit*. Bashing Atari is.

Bye for now,
Anders Skelander etxansk@garbo.ericsson.se

just buy a color monitor?

A multisync monitor can do both color and mono. Unfortunately most
PC-Trash-but-cheap monitors cannot display 640x400 at 70 Hz.

Therefore you have to buy a state of the art multisync or a color
and a mono monitor. Since a mono monitor gives a better sharpness
some people (like me) prefer that.

ACS> SCSI drive for a different SCSI address ? I've got a 30meg Seagate
ACS> drive I'd like to tack onto the end with my 80 meg Seagate. The extra
ACS> space would be great for use with Minix.
For one thing the settings should be in the seagate manuals..
For another MOST scsi HD's (Especially the seagates) use a binary numbering system using three jumpers. YOu have to figure out which is pin one though unless its marked. (On MY seagate drives there were four jumpers next to the drive cable.. 3 were the jumpers I am talking about and the fourth was a parity enable/disable I believe...)
SO you would set the jumpers as follows... (A 1 means a jumper is in place and a 0 means there is no jumper there..)

Jumper 1 2 3 SCSI Address
0 0 0 0
1 0 0 1
0 1 0 2
1 1 0 3
0 0 1 4
1 0 1 5
0 1 1 6
1 1 1 7

Does that make sense to you?

I didn't know they were into Atari? I have known them as being an overpriced suppliers of handgun competition items as well as recently purchasing the WORST handgun manufacturer around(B.F. Arms). I had a Beer Fart in 7mm Super Mag and one in 7x30 Waters. TERRIBLE guns. I hope that doesn't relate to them having Atari, the association doesn't bode well for Atari!

Well you only get Colour out of a Colour monitor, but you can get 99%
real mono out of a Multi-sync monitor, but get a good one like a Nec 3D
or the newer 3DS...

I uploaded PYM in four different parts a couple of days ago, and
you could download only the part that fails. Hope that this helps!
When I first uploaded PYM I knew nothing about the problems some
people have with FTP, so I uploaded the whole demo as one HUGE
file.

1757. Better Technical Books?

Newsgroup: comp.sys.atari.st
Date: 1992-02-21 16:08:54 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992Feb21.160854.26784@cdsmn.mn.org>
Source record: 225617

When I recently purchased my ST, I got the book "ST Internals" with it. There is a lot of good information, but not enough. The biggest problem is that it seems to be a translation (from German, I assume) and a lot of the translations of technical stuff leave you guessing. I would also like to know some things that I don't see yet, although I haven't actually read it cover to cover. For instance, I'd like to know how the video is generated and it's format. The portion on the serial port was really sparse.

Anyway, you've maybe read it, so - is there a better book, or books? Or perhaps another source? I would like to learn not only programming, but the hardware too, as I am better at hardware than I am at software.

Gee, re-reading my message, it sounds like from German it was also translated :)

The best (IMHO) atari mag is still going strong: Current Notes. Email me if you want some details.

I have seen screenshots of Populous II on the ST, so presumably it is coming out for ST's. Has it been released for any other architectures yet?

1760. Wordflair HPlaser Driver, Slowwwwwww

Newsgroup: comp.sys.atari.st
Date: 1992-02-21 17:33:53 UTC
From: komives@lamar.ColoState.EDU
Message-ID: <1992Feb21.173353.43380@yuma.acns.colostate.edu>
Source record: 225543

I am developing this love hate relationship with wordflair. My biggest hate is printing time. I'm using the HPlaser driver printing to an NEC Silentwriter2 90 from my 4 meg 520STE. I have created giant caches (I can't remember the size now, but they are bigger than both the default and what the Wordflair folks recommended when I called about my problem). I takes about seven minutes for a page of text with just a few style changes, and then (unbelievably) when I want two copies of the same page it takes another five minutes. This latter problem indicates to me there is something basic that is wrong. I know the orginal driver had some problems. I got the corrected one, but I believe the problems had more to do with boot-up or freeze-up than with printing time.

Do others have the same problem?
Is there a ready solution?

Please respond either here or by email. Thanks.

Bob Komives

> Steve I can't seam to E-Mail you, but have you Updated UUCODER at all,
> I have not found any bugs but a few feature could be improved..

Not since version 1.1. There are a couple of bugs that need to be
fixed. I noticed the other day that if you uuencode several files,
you'll notice that the segment counter (.uaa, .uab, etc.) isn't reset
between source files. Some informative progress messages would be
beneficial, and it would be nice to be able to halt the processing.
The menu entries probably need some reorganization, and the keyboard
aliases should be updated to conform with Atari's current standard. I
might get around to it one of these days.

(Absolutely free source code to UUCODER is available to anybody who
wants to tinker. No hooks, no copyright.)

The email situation is supposed to be fixed now. The Internet MX
server (mail exchanger) for .mn.org UUCP sites disappeared and had
to be replaced.

1762. CS-TEX install

Newsgroup: comp.sys.atari.st
Date: 1992-02-21 17:35:00 UTC
From: jharres@sleepy.bmd.trw.com
Message-ID: <2510.29a4d5d4@sleepy.bmd.trw.com>
Source record: 225545

I just ftp'd CS-TEX from a.a.u.e and have a question. The files I got were zoo archived so I unzoo'd them to my HD. The enclosed install program only allows one to select the destination of the tex system and not the location of the source (which is hardwired to the A drive). Is there a way to specify an alternate source drive or do I have to put everything on floppies to make the install simple?

Thanks,
Jim Harres jharres@doc.bmd.trw.com

The Mega keyboards are much nicer than the 520 and 1040 ones. I do not
know about the STE's though. One common modification is to by a set of
replacement springs (I cannot remember what they are called, but they are
available from most ST mail order places) for the 520's and 1040's.

1768. Toronto Atari Show - Apr 4 & 5, 1992

Newsgroup: comp.sys.atari.st
Date: 1992-02-21 19:05:45 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1992Feb21.190545.2515@watmath.waterloo.edu>
Source record: 225550
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,uw.sys.atari,kw.micro,ont.micro

On April 4th and 5th, Atari Canada and the Toronto Atari Federation will host what may be the most exciting Atari event in North America in 1992. To be held at the Skyline Hotel on Dixon Road, near Pearson International Airport, , ACE '92, the Atari Canadian Exposition will feature the most outstanding developers in the Atari world with some of the latest programs and program updates. Local dealers will exhibit the latest hardware and peripherals, and user groups from across Canada and the United States will be on hand to share Public Domain and Shareware programs and exchange knowledge. Door prizes throughout both days of the show, special show prices and several major door prize packages will add to the excitement.

Facilities will include a 22,000 square foot convention area, an additional 7,000 square foot display and exhibit space, and 7 separate meeting rooms that will host a wide range of seminars, demonstrations and mini-concerts. On Saturday evening, a formal banquet will bring together local users with major figures in the present and future course of Atari.

This is the third major convention that the Toronto Atari Federation has hosted in recent years. As one of the largest user groups in Canada, if not all of North America, TAF has consistently helped bring the best and most contemporary computer technology to Toronto users. With membership of approximately 300, TAF will provide the core volunteers that make an event like this possible. However, other user groups will also be invited to participate, to help stimulate exchange of information among the various Atari groups in this region and to help broaden the base of support for this special event.

Atari Canada General Manager Geoff Earle has said that this April event could easily surpass the recent Chicago convention, both in attendance and participation by developers and programmers. Basing their participation on the successful Chicago model, Atari Canada will assume many of the initial commitment costs, including facility costs and advertising. TAF will coordinate activities and provide volunteer help. TAF President John R. Sheehan, SJ noted, "The enthusiasm of our members is the reason we felt this was a good time for a show. So many members had been asking about a show, and volunteering to help that we felt we really could present a spectacular two-day event. We couldn't try it without our volunteers, but with their help, this April will see the most exciting Atari show Toronto has ever seen!"

Packets for dealers and developers are being prepared and should be mailed by the end of January. Information packets for user groups will be available at around the same time. The Skyline Hotel will be offering

special room rates to participants, and special travel plans should also be announced shortly.

To be placed on the mailing list for Convention information, please send your name, address, and affiliation (developer, user group, dealer, etc.) to TAF's mailing address, 5334 Yonge Street, Suite 1527, Toronto, ON M2N 6M2 or leave a message at (416) 425-5357.

ATARI TALENT SHOW ANNOUNCED
"""""""""""""""""""""""""""

As part of the Atari Canadian Exposition, ACE '92, April 4/5, a special talent competition has been announced. To demonstrate the many ways that Atari computers can be used in creative entertainment, two divisions will be open for submissions. The contest is open to all Atari Users.

MUSIC AND SOUND

Since Atari has long been an industry leader in MIDI applications, one division will be open for applications of sound and music. Entries may be live performance, combination of live and pre-created or totally pre-created arrangements of music and sound. Entries may be original compositions or adaptations of existing material. (Initial submission must be made on cassette tape; if accompanied by visual effects, appropriate disk program or description must also be included.)

GRAPHICS OR ANIMATION

Since Atari can manipulate over sixteen million separate colors, visual arts provides another rich field for creative work. In this field, entrants may submit animated segments, or graphics displays. Submissions may include "slide shows" of created works, demonstrations of works being created, or animated creations of any type. Entertainment value will be the criteria for judging.

Individual presentations should last no more than 10 minutes. Entries will go through preliminary judging, and those who are accepted will make public presentations or performances throughout the day on Saturday, April 4th, at ACE '92. Performances will be open to those attending the Exposition at no charge, and judging of finalists will take place prior to 4PM. Winners will attend the evening banquet as guests of Atari Canada. Each contestant will present their entries or performances at the evening banquet, at which time they will be judged a second time, and prizes awarded. Judging will be on the basis of creative use of the computer and entertainment value.

FIRST PRIZE in each division will be a $700 gift certificate from Atari Canada, good towards the purchase of any Atari product, and a one-year membership in the Toronto Atari Federation.

SECOND PLACE WINNERS will receive a $200 gift certificate from Atari Canada, and their choice of 10 disks from the TAF Library. Third Place

Winners will receive a $100 Gift Certificate, and their choice of 5 disks.

For an entry form, contact:
ACE '92, c/o TAF
5334 Yonge Street, Suite 1527
Toronto, ON M2N 6M2
Or call:

or
leave a message on the TAF BBs
(416) 425-0318.

ACE 92 TO FEATURE GAMES AND 8-BIT
==========

ACE '92, the Atari Canadian Exposition, will be held in Toronto on April 4th and 5th. As part of the many different events scheduled for the two-day exposition, two separate games areas will be set up with equipment provided by Atari Canada. A nominal charge of $1.00 will be levied for admission to each area, with all funds raised here to be donated to Sick Children's Hospital in Toronto. Admission to the Games Area is in addition to the regular admission charge.

Area 1 - THE LYNX CHALLENGE. The $1.00 contribution admits participants to a timed game playing session. The high score in each session is registered. At the end of each day, a special prize package will be awarded to the high score of the day. The package will be provided by Atari Canada and will include: One Lynx machine, AC adaptor, and a collection of games.

Area 2 - GST AREA (Games - Sampling and TryOut) $1 contribution admits the participant to sample one game cartridge. A variety of games for the Lynx will be available, but each "Tryout" requires a separate admission to the area.

Many of the dealers present will be offering special discounts on a wide range of game for different Atari machines, as well as significant savings on games cartridges and games programs. Although most of the exposition will feature more "serious" applications on the Atari platform, there will be a good selection of games available, and serious players to share hints and help.

There will also be a special area for 8-bit dealers and developers, a place for the dedicated XL/XE user, those who still have and use the 800 and 400 machines. Although commercial programs are getting harder to find, many clubs will have their public domain and shareware libraries available, and dealers who still have 8-bit material will have it available.

ACE 92 will be held at the Skyline Hotel on Dixon Road, near Pearson International Airport.

Further information, exhibitor's kits, advertising rates and advance ticket sales may be obtained by contacting:

From: addison@pollux.usc.edu
Message-ID: <kqatvhINNi0a@pollux.usc.edu>
Source record: 225602

I'm looking for a program that will convert Macintosh bitmap fonts to Digital Research's GEM bitmap font format.

We need to convert a handful of custom fonts. Does anyone have any pointers? Even hints about programs that convert other bitmap font formats to GEM bitmap fonts could be helpful.

BTW, it would be most helpful if the program ran on a Mac or an IBM compatible under MS-DOS or Windows. Otherwise, source for Atari or some other platform would be appreciated.

Thanks!

Wouldn't it be nice if you also made demos which would run in the higher resolution modes of the TT as well as the St and STE.. then I could show off the TT.

Maybe then the TT would get the "Wow!" factor it deserves.

>Someone save me from this grizzly fate and tell me where I could get
>a copy from (and how much its gonna cost :-)
>

According to ST User this month (March issue), and I quote:-
"Also due for the first time will be TTs running Unix. The machines are claimed to be idea cheap cost solutions for programmers, running the latest version of Unix."

This is on the first page of the news section in a box taling about the forthcoming 5th International Computer Show. Next to the blurb is a black and white picture of a TT with a dodgy old monitor next to it show ing X-Windows with the Motif window manager (with xeyes running in the top left corner of the screen).

1778. clock function in Sozobon?

Newsgroup: comp.sys.atari.st
Date: 1992-02-22 00:23:39 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1992Feb22.002339.28838@CS.ORST.EDU>
Source record: 225609

Up until recently I have always been content to do my CS homework via modem on the campus Un*x boxes. But lately the traffic has gotten pretty bad, so I'd like to try doing some of it on my Atari.

To get myself started, I ftp'd Sozobon 1.33i (Good package. "Well Done" to all involved.) However, I am an total beginner at programming on my ST.

Is there a function to read one of the system clocks so that I can tabulate elapsed runtimes? If so, what libraries, #includes, etc are needed to access it? I need resolution of at least one-tenth seconds.

Names of functions, code samples, or whatever, will be highly appreciated.

Thanks,

--

I think one of the reasons why ST application software sucks so bad, is because people like you don't have the proper documentation to work with.

(Possibly with the exception of Turbo C...and Spectre 3.0)

I wonder what kind of demos could be done with COMPLETE massively accessable hardware and system software. IE, walk down to B Dalton and buy it.

I have a feeling most of the demos are a tip of the iceberg of what probably could actually done on the ST, espcially the STE's.

>next year, there's no way I'm looking for a job, I'm gonna be a
>full-time hacker! DEMO CODING HAS DONE THIS WONDERFUL THING FOR ME!!

I am glad you expend so much energy in demo design. However, I hope you realize, that the hacking tradition is dead. Machines are becomming too complicated for one person to handle within the complete lifetime of the target hardware to learn. (Of course, I mean Hacking as in knowing the machine hardware and software inside out).

Not long ago, with an Atari 8bit, a single person could easily push the hardware quickly along a short learning curve. Not so anymore, the ST has introduced several factors relating to modern computing machines which have increasingly common characteristics such as:

Operating system software in the 3rd/4th generation now vastly restricts a single persons view of just what a computer system is and how to apply what they know to solving a given application problem.

a) Whether this is good, or bad is debatable. I tend to foster the view that in general, given the drastic increases in hardware performance, an abstract view of computing application programming is preferable. It enables advantages such as GUI's, portability, which far outweigh the loss of performance of generalizing hardware independant code.

b) Then again, when one sees what can be done with customized hardware code such as TEMPUS...WOW look at it scroll....and the interesting pyrotechnics STE demos have, we are missing out....

I believe we are at the second "jumping" point. Hardware during the next
5 years will enable people to have access to 20-50Mip machines which
will provide multimedia capabilities that make todays demos look like
peanuts. Essentially, what demo people are trying to capture is multimedia.
Its a pity we don't have the hardware/system software to integrate
multimedia into an application sphere which is well defined to produce anything
useful yet...

Although its getting there...

>I hope I've made somebody somewhere enthusiastic about becoming a
>hacker. It's so cool! If you read things like the disk Maggie put out
>by TLB (The Lost Boys), you'll find loads more people with similar
>feelings about demo crews... bye for now... I have to get back to
>shitty 'C' programming now (year out working for a Japanese company)

Hey now, them there are fightin words...obviously, using a portable language
like C is a contradiction in terms if your writing demo programs. :)

>... At least I'm writing a packer I can convert to 68000, and
>use to pack our forthcoming megademo... C ya...

C ya..

] > try it out.

] I too would like to see a post of at least the binaries of MERCURY UUCP.
] Maybe Mr.Covert and I aren't alone????

I think it is better to user Hermes UUCP Software (it is originaly based
on Mercury, but now you didn't need any part of Mercury for it) than Mer-
cury.

With Hermes you have a GEM Based Newsreader and Mailer. And some other Tools
you need (like Sendfile ans so on...).

You can get them from some FTP archives or from the Author, Martin P. Ibert,
martini@heaven7.in-berlin.de.

>using whatever tex utilities the document author uses.
>
>jc cummins@a.cs.okstate.edu

The whole point of an author going to tens to hundreds of hours typeseting the documentation in TeX is to provide the highet quality documentation possible. No easy way exists to convert TeX documents into plain ascii becuase they involve lots of non-text pictures and diagrams and special characters that cannot be converted to ASCII. A TeX to ASCII converter program would essentailly have to be as involved as TeX itself to make automatic conversions, and those would look bad. Also, making the author have to write two versions of the document is not good either.

I suggest that authors create the TeX documents and then format them for as many printers as possible. For on screen viewing, a program like "showdvi" and a minimal set of fonts should fit on one floppy disk.

A facility called "detex" is available on some UNIX* computers, but it make ASCII output that is too difficult to read.

*UNIX is a tradmark of UNIX Laboratories Inc.
UNIX has also been listed as tradmarked by AT&T Bell Laboratories.

Concerning the possible demise of Atari.Archive at UofM,
Dan Hollis writes:

>Actually, the administration's idea of shutting down a.a
>quickly becomes invalid if a.a were to run completely under
>volunteer power. Maybe we can convince them that this
>is the route to take?

Unfortunately, this may be only part of the problem. The amount of
disk storage space taken up by all the different UseNet archives must
be considerable, and the administration may have to be convinced that
they should continue to devote these physical resources to the archives,
even if the labor to maintain them is free...

Just a thought..

I agree about the "spongy" feeling that the Atari keyboard has.

What you could do is buy an interface and use an IBM compatable one.

The *real* IBM one for the PS/2 is really nice... the one that clicks.
I bet it's expensive though.

Craig.

I was going to ignore those messages, but as everyone has got upset by
them, I thought I might reply.

What I think has happened is then Gregory Miller has either logged on,
or found a terminal already logged on under Carter Gregory's account.
He's then posted that message to make everyone flame Carter.

But them again, I could be wrong, they could both be doing it.

Craig.

carter@cae.wisc.edu (Carter Gregory) writes:

:I think one of the reasons why ST application software sucks so bad,is because
: people like you don't have the proper documentation to work with.

Hey, I think you are a bit wrong here. They guy wrote that he had
no documentation when he started out, but I can promise you that
when he once had started he bought some books (Internals for example).
To write good demos and other software you need at least some
information.

: I wonder what kind of demos could be done with COMPLETE massively accessable
: hardware and system software. IE, walk down to B Dalton and buy it.

The demos wouldn't be much better. The kind of code we write couldn't
be documented since we use many 'illegal' ways of making impressive
demos.

: I have a feeling most of the demos are a tip of the iceberg of what probably
: could actually done on the ST, espcially the STE's.

Sorry, but I think you're wrong. We can't do much more with the poor
8 MHz 68000 that sits in the ST and STE. However, on the TT we could
make REALLY impressive things, but unfortunately there are too little
good documentation for the TT.

: I am glad you expend so much energy in demo design. However, I hope you
: realize, that the hacking tradition is dead. Machines are becomming too
: complicated for one person to handle within the complete lifetime of the
: target hardware to learn. (Of course, I mean Hacking as in knowing the
: machine hardware and software inside out).

The ST, STE and Amiga 500 isn't dead yet, and they won't be for
the next decade either (hopefully). So hacking isn't dead AT ALL!

: Not long ago, with an Atari 8bit, a single person could easily push the
: hardware quickly along a short learning curve. Not so anymore, the ST has
: introduced several factors relating to modern computing machines which
: have increasingly common characteristics such as:

The ST has no advanced features that is hard to learn. If you've
got some knowledge of 68000-programming and a good book
(ST Internals for example) you could learn the whole ST in a couple
of weeks. And when you know the ST you could learn the STE in
just a couple of days (with the right documentation).

: --Greg

Please understand that I'm NOT faming you, just correcting
something I think wasn't completely true.

The Feature that was lacking to me was it did not remember the source
Paths and you could not set the destination path, but it works very
well for me, this was version 1.0 is version 1.1 in A.A. ?? Thanks..

>many years.
>

I disagree.
People who owned a '64 usually got an Amiga and Speccy owners got a ST.
Why?
Well '64 owners were used to decent sound/scrolling/graphics while Speccy owners weren't. I had a '64 and got a ST which I was *very* disappointed with (I didn't like the sound and the only decent arcade game at the time was Goldrunner). Hence I now own an Amiga, which seems to be the natural successor to the '64. Still, I'm glad the ST programmers are squeezing as much as they can out of the machine....

1804. Uncompressing EMACS

Newsgroup: comp.sys.atari.st
Date: 1992-02-22 22:34:32 UTC
From: n8742883@henson.cc.wwu.edu
Message-ID: <1992Feb22.223432.2737@henson.cc.wwu.edu>
Source record: 225636

I just spent a huge amount of time dowloading seven large EMACS
files, labelled EMCS1885.x, where x is a number between 0 and 7.
However, the files are not auto-uncompressing, ARCed, ZOOed, or LZH'd.

Any suggestions on how to get them uncompressed?

Thanks in advance,

Perry Pederson

You can get STe addendum manuals from Atari themselves (these are sort of
a developer documentation), as posted here several weeks back, Atari
has made the documentation available for the public. I think the addendum
for STe, new stuff was pretty cheap, $20-$30 bucks or so. So track down
a copy of that order form that was posted here, they have all the official
docs for a good deal.

>space would be great for use with Minix.
>

It is usually a 3 bit binary thing. The simple answer is to find the address jumpers (usually 3 or 4 jumpers in a row near the SCSI cable socket) and give it a try. You can run the idcheck program from ICD hard disk utilties to tell you what the addresses of the devices are. As long as you do not write to the drive, there is no way you can damage anything (at least, that has been my experience with my ICD host adaptor). A couple of tries should be all you need.

The other option is to call Seagates 1-800 number (it should be in the 1-800-555-1212 directory) and ask them. They will probably send you a jumper sheet for free.

It is itself a shell, oriented toward Unix users.

> * * *
>
> Also, what makes GULAM preferable to other (MS-DOS type)
>cli's for the ST?
>

Gulam has extremely little relation to the MS-DOS cli. If you want such a
cli, you could try pcommand (very old, but lots of folks use it) from
atari.archive, or you could get the Neodesk cli (requires Neodesk, which is
a must-have anyway). Gulam, Okami, korn, tcsh, etc are all Unix type shells!

Try joining the files together(minus any headers) and then try to
decompress them.

You're probably right, but I insist on that Atari had the affordable computer and Commodore had an overpriced computer. And I do think that many C64 owners upgraded to the ST. Maybe later, when Amiga prices dropped they upgraded from ST to Amiga.

I must admit I can't understand why Atari had to pick this crappy crappy Yamaha sound chip for the ST. Even a pair of D/A converters would have been better. I sold my 8-bit Atari to get the ST, and I found the graphics hardware particularly disappointing. (The 8-bit had a 256 colour palette, 16 shades of grey, sprites, hardware scrolling, and a graphics chip that was a processor itself.)

I'm sure C64 owners who could afford the Amiga didn't hesitate when the A500 was released in 1986 (1987?), but it's still too expensive for many low-end users.

From: nelson@patriot.Kodak.COM
Message-ID: <2782@eastman.UUCP>
Source record: 225448

PageStream, the desktop publishing program, has the ability to produce as big an output as you need in 'tiling' mode.

That is, you produce your poster in 8 1/2 by 11 inch mode and then tell the program you want to print it at 750% in tiling mode, and you'll get 64 sheets which you tape together to form one huge 5 foot wide output.

As a european Atari owner with an interest in programming, I find that somewhat insulting. It really underlines the sort of juvenile mentality of most people involved in this sort of thing. Apart from the damage done when this sort of programming is used for real software which consequently refuses to work on anything but a subset of the machines its written for, can you not see that you are just wasting your time? This sort of hacking is of no use whatsoever in the real world.

For the record, I write applications, tools and games for Suns, PCs, and STs (well almost - I've never written any games on a PC), and programming tools for transputers.

I think you've answered your own question there - the answer is 'because they're MS_DOS type'. Personally though, I wouldn't choose Gulam anyway - if you're not looking for a mint aware shell, I'd unhesitatingly recommend the Craft shell (written by ComMedia and distributed by Hisoft [in the UK, anyway]). Really though, you should get hold of mint and one of the shells available for use with it - I personally prefer tcsh, but then I prefer c-shells anyway.

OTOH, do you really want a shell? I can't see much use for it if all you want do is run Gem software. Something like Neodesk would probably be a better choice.

1819. Seeking advice: Mac sequencing software with Atari+Spectre

Newsgroup: comp.sys.atari.st
Date: 1992-02-23 16:54:29 UTC
From: ngse18@castle.ed.ac.uk
Message-ID: <18369@castle.ed.ac.uk>
Source record: 225649
Cross-posted to: rec.music.synth,comp.sys.atari.st

I followed the recent rms discussion on sequencers for the Atari, but didn't gain anything from it; whilst I have no wish to reopen the flame-war aspects, I would appreciate advice, particularly from anyone who has tried using Mac sequencers with the Atari+Spectre combination.

I've had my Atari for about six years, but whilst I accept its continuing merits as a music platform, it doesn't fulfil my other needs, and I'd like to trade it in (when resources permit) for a Mac. In the meantime, I have a Spectre Mac-emulator with which I am well pleased.

The low-end Atari sequencers simply do not fill my needs; C-Lab Notator appears to be appropriate to them, but I am reluctant to spend UKL450+ (say USD800) on a product I will have to sell at a loss if I trade my existing hardware. [Also, I'm not impressed by a company which starts its relationship with its customers by saying 'we think you may steal our software, so you may use it only with our key'; I would be constantly shuffling the Spectre and C-Lab cartridges - and I've had bad experiences with other 'copy-protected' software!]

I would appreciate advice on Mac sequencers in general, and to hear about any experiences using them with Spectre - presumably driving a MIDI interface via the serial port (?). Since none of the local shops stock Mac software, I may well have to make my choice in the course of a hurried visit to one of the London stores, so I guess I'll need to go in there well briefed and with a short list of two or at most three candidates!

As mentioned, I have no wish to re-ignite the flamewar, so would you respond by email, please; I will happily summarise, if I receive any expression of interest.

Thanks for your attention!

1820. fortran compiler (good news)

Newsgroup: comp.sys.atari.st
Date: 1992-02-23 17:09:41 UTC
From: rosenkra@convex.com
Message-ID: <1992Feb23.170941.19373@convex.com>
Source record: 225648

there was some discussion about this. recently, a port of f2c (fortran-to-C translator) was posted to atari.archive. i tested it out with version 1 (circa nov 1990) of the Slalom benchmark (in fortran 77), using GNU C (1.40) to compile the resulting C code. zero changes to source, worked fine. highly recommended. Slalom is a "standard" number crunching benchmark. it attempts to find the maximum amount of work that can be done in 1 minute (it always takes 1 minute to run, no matter what the system is). it is all floating point. it can be found at tantalus.al.iastate.edu. note that this version appears to be the original Slalom, ie before the conjugate gradient solver was added. this version is from the Serial/Fortran directory at the FTP site.

for the curious, an 8 MHz mega4 with TOS 1.2 (and no 68881) cranks out a whopping 46 patches (no -O). for comparison, a YMP (1 head, 167 MHz) does 2560 patches and an RS/6000-320 (20 MHz) does 642 patches. a toshiba T1000 (6 MHz 8088) does 12 patches. a mac IIsi (20 MHz 68030, no fp) does 73 patches and a mac with 68882 does 175 patches. the ST runs at about 0.003 MFLOPS. the ST test was run from ramdisk (Slalom measures data read/results write, too). note that i did not have a chance to verify the results on the ST. i presume these other machines produced the correct results. i would guess that with fp hardware and 20 MHz clock, the ST would do about the same as the mac with fp hardware, perhaps a bit better (with gcc -O ...). this is an O(n^3) problem so linear extrapolations are impossible. it also consumes memory at O(n^2), i think. it is supposed to be 64-bit.

From: jared@midiline.la.ca.us
Message-ID: <4qyLgB1w164w@midiline.la.ca.us>
Source record: 225402

Is there anyone here who has The Empire NoiseTracker v 1.5 for their 1040ST or other ST (with a TOS that will allow TENT to run properly) and play or create .MOD files with it? If so, I'm interested in trying to form a .MOD musician group, dedicated to good, wholesome ST/Amiga .MODule music for others to enjoy...

Any other info concerning .MODs of any kind is much appreciated, as TENT is said to only wiork with TOS 1.0, and that leaves alot of other Atari ST users out of the picture.

If interested, please reply in Email to:

Jared@midiline.la.ca.us

Thanks!

1822. Re: Atari Sues Nintendo!

In a previous article, Rod.Fulk@f24.n228.z1.FidoNet.Org (Rod Fulk) says:

>Ps, I believe the lawsuit probly is with atari games and not atari computers..
>The difference being warner still owns atari games and it is not associated with atari computers anymore at all....
>Although atari games still sells game systems such as the lynx...
>Are you confused yet? :)

No, but you are. Let me try to clear things up a little.

Atari Games can only make arcade games under the Atari name. Anything else that says "Atari" on it is either made by, or licensed by, Atari Corporation. This includes their computers and home video game systems--they're products of Atari Corp., not Atari Games.

Atari Games is no longer owned by Warner (although Warner may still own some stake, as it does in Atari Corp.). Atari Games does not make the Lynx. Atari Games does make Tengen game cartridges, though. They use the name "Tengen" because they can't legally use the name "Atari" for any product other than arcade games. Tengen/Atari Games did have a lawsuit against Nintendo because they felt that the lockout chip restricted the freedom of businesses to make cartridges for the NES--Tengen went ahead and cloned the chip, and Nintendo countersued. I'm not sure of the status of this lawsuit. However, since Tengen/Atari Games is separate from Atari Corp. (whose lawsuit this thread is concerned with), its lawsuit is also separate from Atari Corp.'s.

Atari Corporation's lawsuit shares some similarities with Atari Games's lawsuit, though. Atari Corporation's gripe is also somewhat involved with this lockout chip: Nintendo, since they were the only company that could "legally" produce cartridges for the NES, was able to force game programming companies to essentially agree to whatever terms Nintendo dictated. One of these terms was, for a while, an agreement not to make a version of any of their NES titles for any other game system until two years had passed since it had first appeared for the NES. So, essentially, games for any other system would be two years old once they became available. Atari Corporation viewed this as restriction of trade across the entire video game industry--game makers were prohibited from making their own titles for anything but the NES, essentially. By the time two years had passed, the games were too "old" to bother porting, and Nintendo's market share was so huge, there really wouldn't be much of a point in making a version for the other game machines. So Nintendo built up a huge lead in market share at the expense of Atari and other manufacturers. And now, Atari Corporation's lawsuit regarding this matter has gone to court, and hopefully we'll find out the results soon.

Rod.Fulk@f24.n228.z1.FidoNet.Org (Rod Fulk) writes ...]

> Ps, I believe the lawsuit probly is with atari games and not atari computers..

(Rod, please fix your Fidonet gateway so that it wraps lines properly
for Usenet messages.)

Nope. Nintendo has been sued by various other companies (including
Tengen/Atari Games) and has been forced by the Federal Trade
Commission to change some of its marketing policies. Some of those
suits have been handled by the same federal judge, Fern Smith, and
perhaps as a result there is a great deal of public confusion about
this case. But the lawsuit in question was most definitely filed by
the Tramiel family's Atari Corp.

The suit claims that Atari Corp. suffered $160 million in actual
damages during the period of 1986 to 1990. Under U.S. antitrust law
(the Clayton and Sherman antitrust statutes), a damaged party may
collect three times the actual damages.

Atari's case centers on a Nintendo marketing technique under which
Nintendo required independent software developers, as a condition of
becoming certified, to agree not to make games available for
competing systems for a period of two years.

As you remember, Nintendo machines have a ``lock-out'' chip that is
designed to prevent anyone who is not certified by Nintendo from
writing software for Nintendo machines. Nintendo's policy ensured
that Nintendo had a constant and controlled supply of third-party
game software that was not available on Atari or other game systems.

Nintendo stopped requiring exclusivity in December 1990, which is why
Atari's suit covers the period before that date.

Exclusivity contracts are not, in themselves, illegal in the United
States. But under antitrust law, they can be illegal if it can be
demonstrated that they are being used in an attempt to force a
competitor out of business and gain a monopoly. In this case,
Nintendo's own success (an 80 percent market share) becomes an
argument against Nintendo, especially when coupled with a pattern of
other Nintendo marketing strategies that might be interpreted as
anticompetitive.

This case is a jury trial, which is significant in view of the
anti-Japanese economic hysteria that is sweeping the United States.

Lawsuits of this sort rarely go to trial. Most cases are settled out
of court when it becomes clear to the defendant that the plaintiff is
going to collect, or are dropped because the plaintiff determines
that the expense of the lawsuit is a gamble against poor odds.

It's not the STe, Gauntlet II support 4 players via a joystick extender which plugs in the printer port. If you have a printer attached, the game thinks it's a player hammering his fire button on joystick 3 or 4. It's a pain but you must unplug your printer if you want to play Gauntlet II.

What's your problem man? Are you jelous because someone can
write faster code than you? You are completely out of line
here. Writing demos is OF COURSE a good practice for future
games or applications. Since both the Amiga 500 and the
Atari ST(E) has so poor performerance you can't write
everything in C, Pascal or some other high-level-languages!

When I say "Every self-respecting Atari or Amiga owner with
interest in programming is a member of a group/crew" I DON'T
mean those who already are professional programmers. What I
mean is that EVERY programming Atari/Amiga-owner that I know
of from 'my' generation (15-25 years) either is a member of
a crew/group or is a professional programmer.

If you want to complain about things you have no rights to
complain about then please keep it to Email. I even considered
keeping this reply to Email, but I felt I had to 'fight you
off' in public since you accused me and many of my friends
of wasting our time. Are you so narrow-minded that you can't
understand that many people like to write and watch demos???

E. Arthur Brown being a gun supplier seems reasonable. I have an old
catalog of his from just after the flag burning in Minnesota. He had
this idiotic 'article' at the end where he insulted our intelligence by
assuring us that not all Minnesotans are flag-burners. What a bozo. He
sounds like one of those people whose brain turns off when his patiotism
turns on.

I won't make the fatal logical flaw of concluding that all members of the
NRA are such unthinking machines as E.A.B seems to be, but I will assert
that many such patriotic 'machines' are indeed members of the NRA.

In summary, it wouldn't surprise me if E. A. Brown were a gun supplier as
well as an atari supporter.

Btw, before you flame me, remember that I have not stated that I have any-
thing against guns or America or anything, for that matter. I just have
a distaste for patriotism without associated thinking.

There are those of us who are stuck with a single-drive system out of the dark ages which makes things fancier than a nice shell out of the question. The mouse point-and-click gets wearing after a while and makes using de-archivers nigh impossible when the de-arced files will be larger than 500K. A nice shell like Gulam is very nice to have. Without a hard drive, Neodesk isn't really worth the price. I've never heard of this Craft shell, but perhaps that's just because I live in the backwaters of Atari: North America. Therefore, I use Gulam.

No, Gulam has no more intrinsic value than any of the MS-Dos-based shells for a user, especially for one who is more accoustumed to MS-Dos than csh. Nevertheless, it was more stable than the MS-Dos-like shell I was using before, and some of it's csh-like abilities are very nice, especially the built in ue.

No, it doesn't. It depends on the Q factor the picture was stored to
begin with and on the fact that you might want to display SUN 1024*960
24-bit images on a SM124.

However, why don't you write a viewer ? (not a flame, just a suggestion!)

I don't think I ever uploaded UUCODER 1.1 anywhere. The change from 1.0 to
1.1 was the addition of code to set and remember the source and
destination paths (actually lifted directly from ZOOSHELL). Unfortunately,
I don't seem to have the 1.1 sources since my most recent hard disk
adventure. If I find them, I'll make them available. Otherwise I'll try
to reconstruct the changes.

This is not a STe problem, it happens on all machines ! Solution:
disconnect your printer before playing. Reason: the game thinks you are
trying to use the four-player-adapter that was available for the game.

Hope this helps,

Date: 1992-02-23 21:58:22 UTC
From: leavitt@cheshire.oxy.edu
Message-ID: <1992Feb23.215822.5882@cheshire.oxy.edu>
Source record: 225413

3.5 million Amigas sold worldwide... 7 million Macintoshes... CBM running
at a significant profit.

Some facts, now why I bought an a500...

1. $250 for box, external floppy, bigfoot (220 watt p.s.) and midi interface.
2. Access to excellent software... of varying shades of legality, but...
3. Hundreds of thousands of these machines, more being sold every day...
therefore, the computer will be supported, and people will work to make the
most out of what is available... unlike IBM/Mac developers, who seem to assume
that we can all afford the most powerful machines, and ignore the lower end
users.
4. Why I bought an Amiga rather than an ST... basically, 2. if there had
been an Atari person, and not an Amiga person, I probably would've gone the
other way. If anyone is willing to sell me an ST of any sort, with at
least 2 drives, and an rf modulator, package some software with it... I'll
buy it... for under $200 since that is all I have. Also, would prefer
TOS 1.4 or higher... and 1 meg memory.

Thom

I love computers... they're so cool!
~.

I have to support Kevin here. That sort of hacking _is_ nearly useless.
If you do it for fun and as a challenge, that's fine, but don't fool
yourself into thinking that you are learning useful programming techniques.
Hacks are just that, hacks. They will be obsolete whenever the hardware or
system software changes. If you want to make a career from programming,
learn solid techniques and algorithms. (And learn to code well, as judged
by a rational and integrated measure, not just for maximum execution
speed or bombast.)

1835. Dowloading fonts on a Deskjet

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 01:59:37 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Feb23.205937.16928@newstand.syr.edu>
Source record: 225419

A while back, I asked about the possibility of loading fonts into WordPerfect for the ST. The responses that were posted seemed to indicate that WordPerfect used their own fonts in the program so that it was not going to be easy to use any non standard fonts. I've now got a variation of that question...since then I've acquired an HP Deskjet500. When using my ATSpeed (msdos emulator) I download fonts into a 256K memory cartridge for printing with WordPerfect 5.1...Here's the question (or questions):
1. Can I download softfonts into the Deskjet in ST mode? and
2. If so, can I use my msdos fonts?
I figured I might do this in WordPerfect for the ST, but maybe there's some other program that might work this way? Is there such a thing as a softfont downloader for the ST?
Thanks,
Gerry
ggreenbe@rodan.acs.syr.edu

Look your missing the point here, he mentioned nothing technical at all.

DEMO's of the kind YOU and other such crews write ARE NOT good programming
practices. If you started a company, to design app/game software and
pulled half the stunts you do in your current demo's you would go out of
business quite quickly.

With the kind of mentality crew people have in writing demo's, I would hate
to see what kind of compiler or system tools software you would design.

And writing such tools is far more complicated a task than writing raster
software. Its a bit more useful too.

What it boilds down to is, DEMO's are nice, but not useful. They are like
paintings. Meant to be enjoyed, not guaranteed to represent reality, but
simply to be enjoyed.

If you want to design something useful and REALLY prove your worth, try
designing a CAD circuit tester, digital design package complete with
auto-routing, hiearchal design, simulation. Not only does such a package
have to be incredibly fast, but you must DEAL with the human operator.
The impact a app like that would have on the ST would have far reaching
affects, indeed. If the package was portable and of good performance
reaching out accross many platforms, you would/could be VERY famous.

As it is right now, your the master of obsolete video hardware, on a machine with less than 1% of the available computer market world wide. I don't find that very impressive.

Currently, any software you write, never affects anyone outside the ST world. Remember what computers are suppose to do for people?
Most demo's leave out the most complex part of the equation in software design, the human machine interface.

>here. Writing demos is OF COURSE a good practice for future

>of from 'my' generation (15-25 years) either is a member of
>a crew/group or is a professional programmer.

Gosh, I must admit, I don't fit into your classification.

I wonder what that makes me???

>
>If you want to complain about things you have no rights to
>complain about then please keep it to Email. I even considered
>keeping this reply to Email, but I felt I had to 'fight you
>off' in public since you accused me and many of my friends

I think your wasting your time. You seem pretty confident. But there are electronic realms far beyond your imagination that you should visit besides just the ST hardware on your desk. Expand your horizons and find out what else is out there.

If you can construct a program out of assembly language, of medium size, you should try devoting your skills maybe to system design tools.
We need people who are obsessive about efficiency to design compilers, debuggers, integraters, etc.

1838. g++ installation

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 06:58:42 UTC
From: bferrer@Bonnie.ICS.UCI.EDU
Message-ID: <9202232258.aa23623@Bonnie.ics.uci.edu>
Source record: 225422

I want to obtain g++ for the ST, but in atari.archive.umich.edu there
are two folders for g++ they are (from my memory):

/atari/gnustuff/tos/g++/jbammig++
/atari/gnustuff/tos/g++/ababbon_g++
(I think that's right.)

From Readme Files The g++ in ababbon needs gcc to run. The g++ in
jbammig++ does not have any readme files. So, my questions are:
What does jbammig++ need to run? Does it need gcc? Which of the two
g++ compilers is better and easier to install??

thanks in advance,

Bill

p.s. Is there a FAQ on installation of g++???

PRL.PRG is a tiny program used by Prospero Pascal (perhaps Prospero C too)
I remember it was driving me crazy (back when I was programming in Pascal)
because all programs compiled with Prospero Pascal wouldn't run unless
PRL was loaded.
So if SPICE is written with Prospero Pascal, that's what PRL is.

1840. MONITOR PROBLEM

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 07:49:00 UTC
From: v053qhyx@ubvmsb.cc.buffalo.edu
Message-ID: <1992Feb24.074707.25769@acsu.buffalo.edu>
Source record: 225424

HI... I'm hoping someone can answer these questions....
I have an old sm124 it has a SLIGHT(yeah right..) problem..
sometimes(alot of the time) it seems to go black and write text in white..
it inverses but the text is fuzzy and barely readable..then lines will appear
Horizontally and fade back and forth between white and black?!?!? ANy Ideas?
If I hit the monitor it will sometimes become normal again...

Second.. Within the past week my space bar has refused to work a number of timex
also when I hit the "/" key it also wouldn't work.. I tried the old drop
the atari bit to reseat the chips and sometimes it works...If I press on the
"/" key and keep it depressed eventually it works.. I'm wondering.. In the
old 800's their was a tendancy for the spacebar to go, is this same tendancy
built into the 1040's??? This is a very early 1040ST...Does anyone know where
to get 1040 Keyboards??? Does anyone have Best Electronics Phone #?

Also: What happened with the ATARI/GE servicing deal?? Did it ever go through
Can my computer/monitors ever be repaired??? HELP!!! Please send me mail
dont post a response please mail it to me...
Thanx
Jeremy

1841. Editor under mint/mgr

Newsgroup: comp.sys.atari.st

Yes, Populous II is out for the Amiga at least, I saw a copy last Thursday
in the Virgin Games Store in Oxford (don't ask me why I was in Oxford).

Lets hope that Populous II runs on the TT properly. Populous I almost does,
but crashes if you have the TT's speaker turned on or when the first volcano
is built!

Hey man, if I hadn't started to write demos I would never have
learned the 68000 as good as I do now. And you are utterly wrong
when you say "but don't fool yourself into thinking that you are
learning useful programming techniques". Of course I learn useful
programming-techniques!!!

I don't really think you know what a demo is, or how the code looks
like. I admit that removing the borders and things like that isn't
a good programming technique, but HEY, we do other things than
removing borders!!!

And one thing more that you are utterly wrong about: "Hacks are just
that, hacks. They will be obsolete whenever the hardware or system
software changes". HOW CAN YOU SAY SUCH A THING???
What would todays software be without hacks? NOTHING!!!
Please read some JARGON-file or some FAQ of what a real hack is!!!
To remove the borders on an Atari ST(E) isn't a hack, it's a
trick, and even a lamer can understand that a trick isn't the
same thing as a hack, PERIOD!

BTW, I use "solid techniques" when I don't write demos. A demo
is a demo (the way I define it), and it's NOT supposed to
work on my neighbours Amiga or the schools Mac. Neither is it
supposed to work on a TT.
The meaning of the demos that me and my friends write is to
take our ST(E)'s to the limit. To take a TT to the limit you
have to do much more.

.....
The PTC1426 (I hope the number is exact) is NO MULTISYNC
==========
It is only a cheap VGA-moitor with only 640*480 and a very high price 998.-DM

Don't confuse: all ST resolutions and TT-Low + TT-Mid are displayed at 60Hz
that's why it works on one monitor.

Recommendation:
1. A cheap VGA-monitor with 1024*768 under the price of a PTC1426.

2. A NO-Name Multysync for all the resolutions and may be even the ST (may need
50 Hz)

```

: >What's your problem man? Are you jelous because someone can
: >write faster code than you? You are completely out of line
:
: Look your missing the point here, he mentioned nothing technical at all.

And you missed the point with the whole thread of letters, so don't
complain!

: DEMO's of the kind YOU and other such crews write ARE NOT good programming
: practices. If you started a company, to design app/game software and
: pulled half the stunts you do in your current demo's you would go out of
: business quite quickly.

If you think we are so stupid that we don't know what's 'legal'
or not you'd better start thinking again. I can't speak for every
demo-programmer in the world, but I know that the people I
know are so skilled that they can tell the differance between
a portable routine and a routine that only works on 4 years old
STs that were bought in Norway.

: With the kind of mentality crew people have in writing demo's, I would hate
: to see what kind of compiler or system tools software you would design.

What the hell has compilers to do with anything. We were talking
demos here!!!

: And writing such tools is far more complicated a task than writing raster
: software. Its a bit more useful too.

I agree that it's more useful. But I recent your other sentence.
Have you EVER seen a good demo? To write portable system tools
you need to know something about many machins while when writing
demos you need to know everything about one machine. Correct me
if I'm wrong, but I see a little differance there.

: What it boilds down to is, DEMO's are nice, but not useful. They are like
: paintings. Meant to be enjoyed, not guaranteed to represent reality, but
: simply to be enjoyed.

You missed one IMPORTANT thing: Many demos are written to prove
how good one are at controlling the ST(E).

: If you want to design something useful and REALLY prove your worth, try
: designing a CAD circuit tester, digital design package complete with
: auto-routing, hiearchal design, simulation. Not only does such a package

: have to be incredibly fast, but you must DEAL with the human operator.
: The impact a app like that would have on the ST would have far reaching
: affects, indeed. If the package was portable and of good performance
: reaching out accross many platforms, you would/could be VERY famous.

Hey, I've never said I wanted the whole Unix-world to know
who I (or my friends) am (are)! I'm quite satisfied as it is now.
And I must admit that I'm not skilled enough to write what
you just described, but I'm not depressed for that.

: As it is right now, your the master of obsolete video hardware, on a machine
: with less than 1% of the available computer market world wide. I don't
: find that very impressive.

Neither do I! And hey, I'm NOT "the master of obsolete video hardware".
I've never said that. But then again, I've never heard of you either!!!
If you're so famous and good at programming, how come I've never
heard of you. Could it be because you aren't famous?

: Currently, any software you write, never affects anyone outside the ST
: world. Remember what computers are suppose to do for people?
: Most demo's leave out the most complex part of the equation in software
: design, the human machine interface.

Well, what can I say? You are hopeless! You have totally missed
the point with demos on the ST(E). I've never thought my demos
would "affects anyone outside the ST world".
And please remind me of what "computers are suppose to do for people"!

: >When I say "Every self-respecting Atari or Amiga owner with
: >interest in programming is a member of a group/crew" I DON'T
: >mean those who already are professional programmers. What I
: >mean is that EVERY programming Atari/Amiga-owner that I know
: >of from 'my' generation (15-25 years) either is a member of
: >a crew/group or is a professional programmer.
:
: Gosh, I must admit, I don't fit into your classification.
:
: I wonder what that makes me???

CAN YOU READ? I wrote "EVERY programming Atari/Amiga-owner that
I know". Do I know you? NO!

: I think your wasting your time. You seem pretty confident. But there
: are electronic realms far beyond your imagination that you should visit
: besides just the ST hardware on your desk. Expand your horizons and
: find out what else is out there.

What kind of computer do you think I'm hooked up to? An Atari?
More like a SUN 3/70!!!

: If you can construct a program out of assembly language, of medium size,
: you should try devoting your skills maybe to system design tools.

: We need people who are obsessive about efficiency to design compilers,
: debuggers, integraters, etc.

Well, I must admit that I can write a totally 'legal' assembly-
language program of medium size, but I can't write system design
tools. I know too little about such things still (but I'm trying
to learn). I know that I can't go on programming demos (now quite
useless since I already know the 68000 and the ST(E)) for ever,
but it's MY life, and I decide when I want to stop making demos!!!

I do not think Spectre 3.1 (if ever released) will support AppleTalk.
_We_ (the creators of 'STalk' an me)
are currently trying to patch the AppleTalk system software in order
to run via the TT's LAN port. It is nearly finished, but the remaining
problem is the TT's speed, because the timing loops in AppleTalk are
hardcoded, and it is not that easy to figure out how to change them
for TT performance.

Yet we have not made any decisions about selling or distibuting STalk for
the TT. I think we should get it going first. So please stay patient,
I'll post any new information to this newsgroup if the time has come.

There should have been an "STe ADDENDUM" given to you with your
STe. It contains info on what the STe has over the STFM etc.

Controller Ports
---------- -----

The STe computers have two 15-pin connector ports located on the left
side panel to the right of the cartridge port. Use 15-pin connectors
with 9-pin adaptors to allow four-player games (or six-player games with
joysticks connected to the two 9-pin joystick ports), enhanced
joysticks, paddles, or light guns

Pinnout Specs

Port A
1- Up 0
2- Down 0
3- Lt 0
4- Rt 0
5- Pad0Y
6- Fire 0
7- VCC (+5V DC)
8- Not Connected
9- Ground
10- Fire 2
11- Up 2
12- Down 2
13- Lt 2
14- Rt 2
15- Pad0X

Port B
1- Up 1
2- Down 1
3- Lt 1

4- Rt 1
5- Pad1Y
6- Fire 1
7- VCC
8- Not Connected
9- Ground
10- Fire 3
11- Up 3
12- Down 3
13- Lt 3
14- Rt 3
15- Pad1X

This would not be a tremendous problem for ftp to a well-connected site.
The actual transfer would take quite a bit of time, of course...
>
>Anyone have any other ideas? We need a solution quickly!
>
>Actually, the administration's idea of shutting down a.a
>quickly becomes invalid if a.a were to run completely under
>volunteer power. Maybe we can convince them that this
>is the route to take?

Only the PC and Mac archives at umich.edu receive any funding from the U.
The Atari archive has always been purely volunteer driven since its creation
(in 1987, by yours truly). As the original message that Jeff posted indicates,
management initially wanted to remove the archives completely and also ruled
out the possibility of continuing them even on a volunteer basis. Since there
has never been budgetary support for the Atari or any of the other archives
at umich (aside from PC and Mac), I find the rationale for discontinuing them
highly suspect.

In the ensuing time since Jeff's posting, there has been a considerable amount
of discussion (internal to UMich) regarding the fate of the archives. During
that time, a clear statement was made that the archive service will be shut
down. The discussion is still continuing, however. If you have used the
archives and would like to see them continue to exist, and would like UMich
management to allow us volunteers to continue to maintain them, send your
letters of support to
archive.support@atari.archive.umich.edu

If you have ever been affiliated with the University, you may want to also
note that association in your message.

I personally would be rather perturbed if the archives are shut down, but I'm
beginning to think that moving the crew to a new home wouldn't be a bad idea.
Certainly would be good to live at a site where the administration actually
appreciates the value of what they have, instead of one that only becomes

aware after a world-wide outcry arises.

Disclaimer: this posting has absolutely nothing to do with JPL; I speak as a former U of M staff member and a disgruntled Atari archivist.

I wonder if that's why over a million c64's were sold over Christmas..

So how cheap is a ST nowadays?
I've seen A500's for 299 pounds - I remember that used to be the price for
a 520 ST.

From: sidney@bonfire.med.ge.com
Message-ID: <1992Feb24.152645.8521@mr.med.ge.com>
Source record: 225435

I've got a friend that has recently picked up his first computer -- an old ST. I would like to be to help him out, grabing some of the utilities and applications available from the atari ftp servers.

The problem it that his floppy is a single density 3.5" drive (360K). Is there any way I can read / write or transfer data from either an IBM or Sun dikset?

I do not know what version of TOS his is using, I've looked at the display, at boot, this did not provide any useful info. (read - he does not have any manuals).

Any help would be gratefully apreciated. I want to make his experience with his first computer a rewarding as possible

You miss the point -- Kevin doesn't really care that you can write faster
code than he can, and neither would any professional programmer. You may be
a good hacker, but what you the code you write is just that -- a hack.

A good appreciation of algorithm design would make you a better programmer,
as would losing the juvenile attitude.

>If you want to complain about things you have no rights to

Are the files from Microsoft Write compatible with those of Microsoft Word
on a PC? Can you run Microsoft Write from a DS floppy drive, or do you need
a hard drive? And I assume MS Write is no longer available, so I have to find
a used copy.
My wife uses Microsoft Word at work, and would like to be able to run it
at home. So do I need to buy a PC?

Thanks.

1861. Demos and Systems Software

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 17:13:44 UTC
From: vatec@sun.pcl.ac.uk
Message-ID: <1992Feb24.171344.21794@sun.pcl.ac.uk>
Source record: 225445

I think I should throw in my penn'orth....

I consider myself a bit of an expert at the ST, and yeah, I too
know the machine inside out blah blah blah.... I learned 68000 in a very
shot space of time, and indeed it is rather a simple language to learn.
Of course the trick is to use it.

Having programmed some pretty cool stuff (I think so anyway), and
got a great kick out of watching the whole screen distort in overlaid
parallax layers at 60hz refresh rate after doing it myself, I can appreciate
the satisfaction to be had out of Demo programming. BUT, and this is the
key point here, so much has been done already that it is almost impossible
to come up with a completely new concept. After the level 16 fullscreen
demo in the Union Demo (remember THAT?) and then its big brother - the
fullscreen demo in the cuddly demos (still my favourite), I'm afraid any
newer full screen demos just dont impress. Its all been done before, and
of course, it will only run on the ST.
Repeat this * however many rehashed stuff has been done....
It was great the first time round... really great, and I can still remember
to this day the awesome unbelief with which I held that fullscreen cuddly
demo...

What about the BIG demo? Or the 'Demo3' also by TEX before that? They
were all milestones, a bit like the jet-set willy of Demos....
Now I just like to look at it.

To me, the best part of demo programming would be the 'everyone gets together
with loads of hardware and has a big party for a week and get drunk' part....
The demo is only something to do while your there.

I'm sorry to say it, but the magic of the old days is gone.
Its all so common now, that it doesnt impress any more.

Has anyone else used the keyboard Z80 processor to GENUINLY multi-task?!
(I've only done it in the concept of Demos though....)
--

For the record, I am also an ardent C programmer, and totally crazy about
UNIX. I write loads of UNIX C, even re-inventing the wheel, and inventing
little tricks and quirks....

My favourite program (but one they wont let me run here :-(is my 'catchfinger'
which, when people use 'finger' on me, greets them by their real name!
Even when I am logged out... A neat little program, if a little processor
intensive.

Currently I am working on:

1) A Game for the ST
2) A UNIX shell for the ST
3) A UNIX-type filesystem for the ST, only better,
4) Expanding my 'throw things round the screen while playing samples' code
5) Using CuBase to write an album (hehe).
6) Playing lemmings....
7) Looking at GIF's

And thats about it really.... 'cept for my girlfriend...

Oh, yeah - just remembered - I'm doing a computer science degree too....

Long wasnt it... bit like the scroller in the BIG demo.
To all those who have sent me disks - standby, posting back tomorrow!

Edd Deegan
vatec@uk.ac.pcl.sun

PS: If anyone knows Brian Shoreland (F.B.I) in Somerset, could they tell
him that Lisaber (thats 'LEE-SAR-'b' (as in 'bear)) is posting him some
stuff this week so to standby.

Oh, and mail me to let me know he got the message!!!

Edd Deegan
vatec@uk.ac.pcl.sun

1862. Atari stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 17:21:32 UTC
From: cmerz@ics.uci.edu
Message-ID: <9202240921.aa03973@Paris.ics.uci.edu>
Source record: 225439
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

Last week, I posted a list of Atari stuff for sale but the hardwared spec's weren't very specific and I didn't mention that I wanted to sell the whole system for $500 or best offer.

Here's the revised list:
Atari Mono Monitor
1040STf (floppy drive not working correctly. I'm told that shouldn't cost more than $80 to fix)
ICD Advantage Plus hard drive interface in its own casing with its own power supply - this is a nice custom job
Spectre GCR with ROMs
EZTRACK software
All the necessary cables

I'm hoping someone whose more in touch with the Atari community will take the whole system off my hands and sell off what s/he doesn't want to fellow Atarians.

Thanks,
Chris Merz

1863. Re: 'Demo crews'

I admit... I don't understand the problem here. People like to write demos, and whats the problem with that? You can't assume that they can't write good code, or legal code, and could never write a game or something. Lets look at some of the things that come from some demo programmers.

How about the .MOD players.. they originally came when the demo programmers wanted better music for the demos.. and .MODs have grown much more popular on the ST(e)'s since then.

If you say they couldn't write code to work on all machines.. what?? Most demos I have seen work on most or all STs. Some don't work on strange new Tos versions, but then alot of programs stop working when the next Tos comes out.

And look at Thalion software. They make some of the best games for the ST, and from what I understand they went and hired 'The Lost Boys' from seeing their demos.

Demos are basicially art. You can't design a circuit with it, publish a paper, or call a bulletin board.... but that doesn't mean they are bad. In fact, demo crews tend to be respected by the average user, and I have seen alot more people get into programming because of a slick demo then by a word processor.

Another point was the fact that they aren't portable between computers. Well.. if they wrote them in C (which they can't..) they would be. So you are criticizing them for choosing a different, more complex programming language?? Strange....

Just my personal opinion..... Paul.

1864. Some new stuff ftp-able

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 17:35:13 UTC
From: Jeroen.Scheerder
Message-ID: <2119@accucx.cc.ruu.nl>
Source record: 225447

I have recently sent the following files to both atari.archive.umich.edu
(let's all hope they *stay* there a while!) and archive.cs.ruu.nl. The
latter site may be preferrable for Europeans.

* guck18.zip
The coolest file viewer in the history of mankind.
Displays metafiles, pictures in almost every format
including IMG, degas, doodle, neochrome, you name it.
Displays text files, WordPlus files, binary files etc.
etc. and is smart enough to figure out which is which.
A serious candidate for the honorary pizza in the
Mondo Cool Contest;
* lmf117.zip
Let 'Em Fly v. 1.17. Replaces the standard ST dialog
handler by one that supports keyboard handling, has
flying dialogs, *jumping* dialogs (dialog moves to mouse
if clicked *outside* of a dialog) and has tons of other
nice features. Another heavyweight candidate for MCC.
* life4b-u-p.zoo
An update to (grin) the famous Game of Life for the
Atari ST. Written by yours truly, it is a very much
aestheticized improvement of previous releases.
Some bugs were fixed too, but the most important
difference is in the user interface. The program now
has movable dialogs, which have keyboard-selectable buttons,
that are drawn in a Macintosh style (really!).
Checkboxes are real checkboxes, that can be [un]checked by
clicking the adjacent text, radio buttons are circle-shaped
and much much more. MCC? Who knows :-)

The 'life' stuff might get renamed to something more decent, I
have only requested that its name contains the 'life' and '4'.

Enjoy! Jeroen.

1865. ToadFile 44 For Sale w/ Adapter

1867. here is the Telnet/SLIP for GCR info...

Newsgroup: comp.sys.atari.st
Date: 1992-02-24 19:55:17 UTC
From: wmagro@uiuc.edu
Message-ID: <1992Feb24.195517.13459@ux1.cso.uiuc.edu>
Source record: 225450

As I mentioned last week, cicso has modified NCSA Telnet 2.3 to work with an internal SLIP driver. The source is not available, though I have tested the binary inside of spectre with no difficulties. I recommend at least a MNP modem to use this. Straight 2400 baud is a little painful (and all that I have). It performed quite nicely when I hooked it up to a sparcstation at 19200 baud. Don't bother getting this unless you have a slip connection on the network end already. Many terminal servers support slip, so you may well be able to get a permanent internet address assigned by your network people. Some terminal servers provide dynamic addressing, so that they give you a new address each time you dial in.

For those who don't know, slip is Serial Line Internet Protocol. By 'wrapping' tcp/ip packets and sending them over a serial line (modem) your computer effectively becomes a node on the network, with full telnet and ftp capability (simultaneously, of course).

The binary does not come with any docs, though a couple of the sites below do provide a 'config.tel' file to get you started. This file is required! There is a line in config.tel where you tell NCSA/Telnet how to connect. The old options were ethertalk and appletalk. Cisco's version adds slipxxxx, where the x's are replaced by your line speed. 2400 baud connections then are 'slip2400'. Simple enough, and it works!

You need SpectreGCR or a Mac for this one folks. Here are the few sites I know of (besides ftp.cisco.com which can be difficult to reach):

Ok, my list of Atari Stuff for sale has been greatly reduced. Sorry for all the troubles in first round of selling. Here is what I have left:

Atari items for sale:

Note: Prices are open to bargining

Hardware:

520 ST (upgraded to 1 meg) + Atari SC1224 color monitor + Double Sided Disk Drive: $350

1040 ST + Atari SM124 Monochrome monitor + PC Ditto II (IBM emulator) installed + tweety board (stereo sound) installed + internal drive:$500

NEC P2200 - Epson LQ compatible 24 pin printer: $200

Panasonic KX-P1091 - Epson compatible 9 pin printer: $100

Practical Solutions cordless mouse: $50

Productivity Software:

(With documentation)

Degas - paint program $5
VIP Professional - Lotus 123 compatible spreadsheet $15
LDW Power - Better Lotus compatible spreadsheet $25

(Without Documentation)

Universal Item Selector II - replacement for item selector $5

Games:

(With Documentation)

Dr Doom's Revenge $7
Winter Games $7
Flight Simulator II $10
Arkanoid II $10
Phantasie $10
Phantasie III $10
Heroes of the Lance $10
Emmanuelle $10
The Hunt for Red October $10

(Without Documentation)

War in Middle Earth $10
Gauntlet $5
Barbarian $5
Bard's Tale $5
Harrier Strike Mission $5

>know of a fix for Gauntlet 2 on the STe? Or maybe my copy is screwed?

The copy is OK, I think - I had the same problem once with a Mega ST.

Try disconnecting your printer from the parallel port - Gauntlet 2 expects a four-player-adapter there and seems to get confused by the signal levels caused by the printer (even if it is switched off).

Bye,
Martin

Regarding the PRL.PRG...

The current versions of the Prospero compilers do not require the PRL.PRG
program anymore. I know their Fortran was updated at least 2 years ago
to no longer need it. If the person who compiled and posted SPICE
could recompile it with the new version, that would solve the problem.
I'd be willing to do it, if the source were available but I only have an
old PC spice and couldn't get it to compile...

: >understand that many people like to write and watch demos???
:
: I like demos -- they're fun -- but they're not really useful. What annoys
: me, certainly, is the "Demo programmers are the greatest that ever walked
: the earth, and I'm one of them" attitude.

Do you really think I've got that attitude? You are true when
you say that demos aren't very useful, BUT they can be of
some use if they are shown in shop-windows or if someone
after seeing a demo runs home and orders a copy of Devpac
or some other assembler (to try to learn 680x0).

I admit that I'm proud of beeing a member of a famous demo-group,
but have I ever said that we (or I) are better than some other
professional programmers? What I might have said is that we are
better than some other demo-groups (and that's not only my own
opinion). And when I say 'better' I mean that we know more
about the ST(E) and how to control it to gain maximum speed
when manipulating graphichs and calculating things.

>bekommt man diese Zeichensaetze , sind sie frei erhaeltlich?

Hmm, at first, when posting articles to this group write them in *ENGLISH*, not in German! (German language groups are your local groups 'north.*' plus the Germany-wide distributed 'de.*' groups)...

But now to your question:

Yes, you'll need special fonts for printing on the HP Deskjet (I think you mean *THIS* HP inkjet printer).
Signum!-Fonts are:
fontname.E24 screen font
fontname.N9 9 pin dot matrix printer font (240*216 dpi)
fontname.N24 24 pin dot matrix printer font (360*360 dpi)
fontname.L30 laser printer fonts (300*300 dpi)
(Deskjet uses laser-printer fonts)
Further you need a special printing program for each kind of printer. See Signum!2 documentation for closer Details...

You might convert your N24 fonts to L30 fonts with a small font-converter which is packed delivered with Signum! 2 (bad method, since converting tends to distort your font a bit and believe me, you'll see that on a Laserjet/Deskjet!)

OR

You try to get new fonts for these. I some public domain 300dpi fonts for Signum!2 here, (~200 fonts, some quite good) which I intend to upload to atari.archive.umich.edu within the next days...

Hope this helps

Benedikt

Yeah, right, like I'm jealous of the way you can spell faster by leaving out important letters (that was a [weak] attempt at an analogy, not a spelling flame)

> here. Writing demos is OF COURSE a good practice for future
> games or applications.
Writing demos may well be - jumping straight into dodgy coding practices before exploring the alternatives certainly is not. Oops, just noticed the last two words - writing these sort of demos has no relevance to any applications I'd trust near my hard disk.

> Since both the Amiga 500 and the
> Atari ST(E) has so poor performerance you can't write
> everything in C, Pascal or some other high-level-languages!
>
Nobody's ever claimed that you can. OTOH, there's nothing inherently risky about using a low level language. Its *how* you use it. Its part of what I get paid for to know when to use machine code.

> What I
> mean is that EVERY programming Atari/Amiga-owner that I know

> complain about then please keep it to Email.

Sorry, I thought this was an open forum..

> Are you so narrow-minded that you can't
> understand that many people like to write and watch demos???
>
You've missed the point. I obviously don't care if you want to spend your time writing demos or not. However, you're kidding yourself if you think you're at the leading edge of computer programming doing things this way. I say your wasting your time because whatever knowledge your gaining is applicable only to the ST, a machine that is already out of date. Worse, the sort of coding you're involved in simply has no relevance to modern computers. On a unix machine, the superuser doesn't even have permissions to do anything like this.

Then there's this myth that hacking makes one some sort of super programmer. By definition you've given up on fine tuning your code, etc, and taken the easy road out and jumped straight into writing low level code that is not even portable between different versions of the same machine - this is supposed to indicate some sort of skill? Again, its all very well if all you want to do is a demo, but for anything else - give me a break.

There's much more that could be said on this, but why bother. Instead here are two points to consider:

1) Whilst I'm sure you're a great programmer (I think you told us a few messages ago 8-), I wouldn't even consider putting anything written by you anywhere near my hard disk (If for example you'd written, say a database).-

I say this because I know that you would have no compunctions about writing code that might fall apart if it doesn't find everything exactly as it expects it.

2) Even if you were allowed to take whatever liberties you felt like with the machine, I very much doubt that you could come up with anything even close to MiNT, and furthermore, I'm prepared to bet that most of what Eric Smith may have learned in putting together MiNT will be transferable to other machines he works on.

Kev

A good point. Its all to easy to forget that the standard ST doesn't come
with a hard disk. One of the good things about writing for PCs is that you
can take it for granted there'll be a reasonably fast storage device attached.-

> I've never heard of this Craft shell,
> but perhaps that's just because I live in the backwaters of Atari: North
> America. Therefore, I use Gulam.
>
It's a really nice shell. It's feel is csh, but it has a few feature from
other shells. Documentation is excellent, and it comes with a highly
configurable editor which is extremely fast and supports folding. My main
criticism is it neither the shell nor the editor run properly under MiNT.
One important advantage it has over any of the mint aware shells, is
that a large number of the standard commands are built in. I did a demo
of Mint on two floppies for a friend (mint, tcsh and mgr on one disk, the
ls, cp, etc on another) and it was painfully slow. OTOH, he didn't complain,
so perhaps if you're used to floppies it isn't so bad?

> No, Gulam has no more intrinsic value than any of the MS-Dos-based shells
> for a user, especially for one who is more accoustumed to MS-Dos than csh.

I'd disagree. Gulam has a lot of really useful features (at least I assume
it has most of these) that MSDos doesn't - eg, aliasing, filename completion,
sensible environment handling, a powerful script language, etc, etc. I've
installed 4dos, which adds some of these featues, on my PC in work, and it
makes it quite a bit more pleasant to use. I really must look out for a csh
implementation sometime - anyone care to recommend a good PC one?

Kev

Out of curiosity.. how can you use a CD Rom drive on the ST? The drive itself is nice and cheap, and can read lots of different disks (clip art, fonts, etc), but I don't know if it will work with the St..

TOS 1.4 (and I assume higher) will format MS-DOS compatible disks. Otherwise, I believe DC Format from double click software will do it. Good Luck,
Rob

1881. C-LAB ST-ATARI series

Hi Guys,
my name is Shane.

I am looking to buy a music machine teacher, such as
C-LAB ST-ATARI series.

I believe this one not only teaches you how to play music, but
it also has the capacity for you to compose your own music and play it
using its C-LAB software and with the appropriate Atari.

It is a complete kits for any music lover, I believed!

What I would like to know is how much does it normally costs (software and
harware separately please) and where to get them.

Thanks in advance.

Shane.

The ST essentially has the same file format as the IBM, except for an added boot sector in the IBM format. Many ST formatters will format in IBM mode, and these disks will work with the ST. Your other option would be to format a disk with your MS-DOS machine and copy your text files onto it from your ST. As long as you have no viruses that overwrite your boot sector, the disks will work...

1883. I have TeX documentation for you!

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 05:28:15 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <9733@tamsun.tamu.edu>
Source record: 225369

Abou 4 months ago I release my first draft of a guide called:

So, It's Your First Time to Install TeX on You Atari ST!

Now that I have a hard drive large enough to support both CS-TeX and the manual installation TeX, I have been going over the first draft of the guide and making corrections as I re-install TeX manually.

I want to know if anyone is still interested. And if so, If I may have permission to do the following things to the guide:

- Just talk about the manual installation of TeX version 3.1x that is currently available at the atari.archive.umich.edu site. Chop out the CS-TeX stuff becuase CS-TeX is self documenting.

- Just focus in on "dviprint" and "showdvi" becuase "dvieps" and "dvist" seem to focus in on using the "TEXFONTS" variable that TeX needs for tfm fonts. Also, "dviprint" and "showdvi" seem to support all of the printers available under "dvieps" and "dvist".

- Limit the guide to only talking about configuring environment variables with gulam and with the "environ" program.

Origiannly the guide was intended to be a super document about all TeX programs for the Atari, but I think the guide gets confusing that way. My current goals is to get a final draft of this finished. Then to write follow on drafts.

Becuase IBM made me sign a document stating that any useful though that I come up with is their's and that I have no say so over the future of that thought, I am going to have to copyright the material. The material already has an implied copyright from its Internet Posting last November, but I will have to fully copyright this material if I am going to be allowed to distribute it. In this case, I am continuing the implied copyright with a revision to the originally document thatI wrote before I was employed by IBM.

Mark Lehmann
n160ao@tamuts.tamu.edu

My employer owns these thoughts if they are profitable, otherwise they are mine.

Does anyone have an update on the proposed Atari (TOS) emulator being developed for the IBM. I am getting a 386 for my office, and I am still using my Atari at home. Since I am up to speed using the Atari interface, I would just as soon continue to use it on my office machine. Also, not incidently, I would like to use my favorite Atari software that I am familiar with.

I would appreciate it if anyone has information as to the emulator's development, and REALISTIC timelines as to its availability.

Source record: 225307

Hello outthere!

I recently found the ray-tracer QRT and has traced some picture.
There was a conversion program called RAW2SPEC that was supposed to
translate the traces .RAW file to Spectrum 512, but it didn't work correct.

Now, I ask if anyone out there could help me to write my own conversion-
program.

If anyone out there knows how a file for Quantum Paintbox or Spectrum 512
(.SPC) looks like, please mail me...

If anyone has a working conversion program, could I have a copy???

Thanx.

1887. ST-Floppy-SCSI Problems

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 10:11:05 UTC
From: seelbach@lorien.fernuni-hagen.de
Message-ID: <7678@fuhainf.fernuni-hagen.de>
Source record: 225387

I'm using an Atari 260-ST (1 MB; ROM-TOS 6.2.86) with NEC 1036 (resp. 1037) floppy drives. This (intensively used) constellation works the last years without any problems. Recently I got a SCSI-Hostadapter from ICD and a 210 MB SCSI-Disk from Quantum. The installation and partitioning of the drive brought up no problems, but after about 1 hour of using the system, the drive-select-LEDs of the floppy-drives occasionally start to flicker during transferring data from floppy to harddisk resulting in a TOS error message (something like "drive not responding ..."). Subsequently, accessing the floppy drives failed more frequently and finally, it was impossible to access the floppies at all (LED remains dark while motor is running). Then I have tried to use an original Atari-ST Floppy (SF 314). This works without any problems (on the other hand, the NEC drives are not damaged!).

Using the Atari floppy I filled up the hard disk boot partition. Booting from hard disk and using the programs already installed on the hard disk worked fine (for a short time). After some time the following problems arose:

- sometimes it was impossible to boot more than 1 accessory (that is, the ST couldn't boot at all), sometimes it was possible

- non-empty folders were displayed as empty folders (the ICD hard disk driver catches the "40-folder-bug"!). This happens sometimes after a short while of using the ST and sometimes immediatly after booting the system (after returning from a subfolder the original folder (occasionally) is displayed as empty)

- starting programs or renaming (or copy) files often fails. In such cases the TOS error message "Not enough memory.." is displayed, but there are more than 600 MB Ram-Memory available (only the ICD driver, NVDI and one or two ACCs were loaded memory resistent)

- It is impossible to boot Atari's CONTROL.ACC.

Do you have any ideas about the reasons for the above mentioned problems?

Many thanks in advance, W.Seelbach

From: mro@dcs.exeter.ac.uk
Message-ID: <5634@izar.dcs.exeter.ac.uk>
Source record: 225311

I'm posting this for a friend:

All this talk of demo programmers not writing good code is a load of crap. As a (very bad) demo programmer myself, I have seen some very good code by some of Europe's better groups.

I don't think that people can slag off demos when they obviously don't know what they're talking about. It is true that a lot of the better games now are being written by demo programmers. Look at "Enchanted Land" by Thalion. This was written by the Carebears over a year ago. Show me any other game that has scrolling as smooth as this. Even Wayne "Can't Be Done" Smithson of "Blood Money" and "Anarchy" fame - who thinks his scrolling is good - comes nowhere near Niclas Thissel.

I'm not going to say that languages like 'C' don't have their place, but on the ST they can't come close to assembler for speed, and if you ask me, ease of use. Why do these people own STs and not IBM compatibles? If you're so interested in portability and standardisation, then you should be looking at a different computer...

1892. The best demo.

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 11:21:23 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1992Feb25.112123.13179@newcastle.ac.uk>
Source record: 225286

In my view there is only one realy good ST demo and that uses virtually no special tricks and should work on most machines. Now what I would really like to see is an improved version. The Demo I am talking about is the Snowman Demo. As far as I can see this demo simply does some simple frame swap animation while playing a sampled tune. What would be nice would be to see an STe version that uses Spectrum4096 pictures and DMA stereo sound. The thing could even use 2 or 4 meg of memory, I know nobody with less than 2Meg of memory in his/her STe. How about storing picture sequences on a HD?

The point I am trying to get at is that demo's are supposed to push the machine to the limit right? The thing is all these 1Meg ST demos don't realy do much for a 4Meg machine with a HD and this is becoming a very popular setup.

Dave.

1893. For Sale: MIDI Keyboard $150 (Casio MT540).

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 11:25:37 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.92Feb25112537@zappa.FtCollins.NCR.com>
Source record: 225394
Cross-posted to: misc.forsale.computers,misc.forsale,comp.sys.atari.st

This is a nice portable keyboard (it can run from batteries or adaptor
and has built in stereo speakers in addition to stereo output jack). It
would make a very nice sound box for your computer, would be useful for
someone wanting to get an inexpensive start in MIDI sequencing, or make
a good drum machine for a guitarist.

One of the cooler features is that it can record up to 1250 notes in
its on-board memory. For other specifications see the list below.

The keyboard is one year and 2 months old. It has been used very
sparsely and is in excellent condition. I'm selling because I don't know
how to play keyboards and it's overkill for my modest computer music
needs.

Asking price does include batteries, manuals, and song book, but does
not include shipping. Please specify whether UPS COD or Check->Seller
followed by Item->Buyer is your preffered payment method.

Here is some more data, directly from the Spec Sheet:
```
-----------------------------------------------------
Keys: 49
Polyphonic: 10-note
Preset Tones: 20 base sounds with 10 more accessible
to MIDI only. 210 mixed "tone bank"
sounds are available as combos of the
above.
Auto-rhythms: 20 (49 PCM rhythm sources).
Auto-accompaniment: Casio chord, Fingered 1, Fingered 2
Built-in Effects: Stereo Delay, Stereo Panning.
Memory: 1250 notes
Size: 26 1/8" x 9 3/8" x 3 1/4"

1896. The art of Demo programming (was:Re: 'Demo crews')

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 12:01:40 UTC
From: d91jn@efd.lth.se
Message-ID: <1992Feb25.120140.18971@lth.se>
Source record: 225284

There have been a lot said about the art of demo-programming. This
is just my opinion.

I don't use this UNIX-box at all the same as I use my STe at home.
I didn't bought the STe for running SPICE or writing letters (I know how
to do that by hand ;-), I don't need any computer to keep track of my
addresses or phone-numbers. I don't need it at all.
I bought my computer purely for fun, I enjoy stretching the borders
(very physically as a matter of fact :-), I like writing assembler that
really pushes the computer to the edge of it's capabilities, and even
more I like to rebuild the hardware, make it do anything I want.
The art of computing is soon dead in the Unix-world, when programmers
are told that there is no need for this or there is no need for that.
Programmers should be allowed to find out any tricks they can, especilly
in assembler (because the progs need to be rewritten when one change the
working platform anyhow).
The day a trick don't work, a good programmer will find a new that does,
and users (IMHO) should not bother about how the code is written. If they
don't pay for it they should not even bother about if it works or not.
Programms written for fun are pieces of art, that can not be fully
understood by anyone but another programmer.

>a HD disk with the spectre on the ST?
>

To the best of my knowledge, there is currently no way to use high density
with Spectre. According to Dave Small (although half a year ago) it is not
a likely feature for Spectre 3.1 either.

Is this Mac Superdrive a SCSI device (you are mentioning your host adapter
in the same sentence)? If so, the Megatalk Board might help - but it does
not work with the 1040ST...

1899. MicrOPlay/Microprose vs. STe the Final Chapter

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 14:30:34 UTC
From: dmk@air31.larc.nasa.gov
Message-ID: <1992Feb25.143034.18149@news.larc.nasa.gov>
Source record: 225382

Hi again netters,

*** ON THE SOAPBOX ***

I am writing this Final Chapter in my Stunt Car Racer problem because
of a post I read here some time ago that was written by an Amiga owner.
He pointed out that almost all of the posts in this group were by people
who had problems with their ST's, and then went on from there about the
virtues of that _other_ machine.
Now I feel that sharing your computing problems with the net community
in the hope that others may learn and share while solving these problems,
is the primary role for this media. However, perhaps too many times after
receiving help from this group, we become _too_busy_ to post a follow up
describing the solutions found and in some cases a really happy ending.
Even though my problem was somewhat trivial (I couldn't get Stunt Car
to run on my new STe), I feel it is important to say thank-you to all
those who helped me, to post my experience for those who have the same
problem and want a solution, to show _other_ computer owners that problems
with ST's _can_ be solved, and in the hope that more Atari owners will
follow up with their solutions to problems they have experienced.

*** OFF THE SOAPBOX ***

THE SOLUTION and happy ending,
To bring new readers up-to-date, I bought a brand new Atari STe with
4 Mbytes and found to my dismay that Stunt Car Racer (one of my all time
fav's) would not run. Alan G from Scotland, said that he was aware of a
budget compilation that included Stunt Car Racer and was STe compatible.
I called my favorite mail order house, Joppa, and they gave it a name and
a price.
Challenges 38.50 US dollars
Stunt Track Racer
Kick Off
Super Ski
Fighter Bomber
Pro Tennis Tour
They did not know if the Stunt Track in the collection was STe
compatible, but based on Alan G's advice, I purchased it. It came last
Friday and it runs like a champ!!! John Henders, from Canada, wrote that
Virtual Reality also includes Stunt Car Racer and that too can be
purchased from Joppa.
Virtual Reality 38.00 US dollars
Stunt Car Racer
Starglider 2
Carrier Command

Midwinter
Intern'l Soccer
However, since I didn't buy it, I have no idea if it is STe compatible.
Thanks again for all the help.

Daniel Koppen

1901. MIDI file PLAYBACK program almost ready

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 15:05:40 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Feb25.150540.21945@echo.philips.nl>
Source record: 225308

Hi netters,

As I told in previous postings, I am busy with the playback program
for MIDIFILES. I got a lot of responses, and that is the reason for
this, ahum, progress report.

The program has been alfa tested begin of this month,
and beta testing has started from 15 Feb.

Next week I will start reparing the bugs found by the beta testers.
And after some regression tests, version 1.0 of playback will get distributed.

As this version runs on atari ST, I'll try to get it distributed via
comp.binaries.atari.st (sp?), and placed on several ftp sites and
email archives.

After that, I will continue working on the program by adding
some more features for version 1.1 for Atari ST.

After that I will start with a version for MS_DOS.
As I need some programming practise for MSWINDOWS3 this playback
program will be based on windows as well. But a first version for
this machine will not be available until may/june, I think.

OK, that's for now.

So just be patient for a few more weeks.

John

PS. you can email me for details on the program
(in case you missed the previous postings).

>>If you are interested in an SVR4 TT, contact Alistair Bodin at Atari UK.
>>The developer version with tools etc is 3000+VAT I believe.

>That seems a bit steep, unless that includes the TT and Monitor. Is there
>any news about a drive + software only version?

>>Atari UK - 0753 533344
>>

I was at the 16 bit computer show in London on Saturday (15th) and atari had
svr4 on demonstration there. The configuration was a TT030 with 12Mb ram,
350 Mb hard disk and 19 inch mono monitor. They had X windows and motif
running on it and it looked a very stable port.
The price quoted was 3000 pounds, for the availibility ring atari in Slough,

I did manage to pick up a copy of Tos 2.06, NVDI and a hardware manual for
an STE (all at a computer show !!! things are improving).

Tos 2.06 is effectivly Neodesk in a ROM, the functionality is the same it makes
me wonder if atari subcontracted the work!!

>The point I am trying to get at is that demo's are supposed to push
>the machine to the limit right? The thing is all these 1Meg ST demos
don't realy do much for a 4Meg machine with a HD and this is becoming
a very popular setup.

Demo's are supposed to push a machine to it's limits. For some
people programming is fun, and doing demos are a laugh. They may say
they are the best, but i'm sure they mean at fast assembly routines, that
entertain. I can't see them really believing that because of a demo that
means that their also the best C, Ada, or whatever programmer. To be
honest i don't really see the problem. They do a good job of advertising
on a cheap medium (PD) what a machine is capable of.

You don't see this kind of stuff on a mac, pc, sunsparc, maybe
this is detremental to its view as a serious machine, but what the heck
(to coin a phrase) it's FUN!

I think you can do this without additional software. If you can format
a 720k 3.5" disk on the Compaq, both the ST and the Compaq can read or
write its files. Old STs can't create the DOS-format without additional
software.

Source record: 225385

Geez, will you guys give the "demo coder" a break? There is absolutely nothing wrong with coding demos and pushing the machine envelope. You are assuming that this *automatically* makes for bad coding practices. That is NOT a valid assumption. Just because someone choses to ignore "good practices" does not necessarily mean that they do not know what "good practices" are!

Let's look at a good analogy: The engineers and mechanics who build race cars. They build race cars for one purpose only, to push the machine envelope (i.e., make it is go as fast as possible - [yes, I know that there are other constraints]). These same people would not even thing of going home and making the same modifications to their wives' cars. They *know* the difference in the purpose of the vehicles. Yet you cannot deny that the ideas and techniques that they use (i.e, the tecnology) *MAY* have applications for mass-produced cars. This is exactly why many of the major automotive manufacturers support racing teams.

Now, back to demos: I agree that the "we are the greatest" attitude of demo coders wears a little thin, *BUT I ENJOY WHAT THEY DO*. I sure as hell did not buy my 1040ST (now with Adspeed because some engineers tried to push the envelpe) and my 1040STE so that I could run a clone of some ported IBM software program. (As a matter of fact, I generally *hate* ported programs because they do not take advantage of the machine.) I bought Atari's for what they could do, what they are capable of. And only demo coders's programs can truly show the capabilities of the machine (which are AWESOME, especially considering the price I paid).

And I am not able to impress my kids or wife (or friends) with just how much capability this STE has by downloading another text editor accessory. But when I crank up LLamatron, Protracker, or several other demos the amazmement in their eyes is indescribable (sp?).

So let the demo coders go about their work. And be thankful that someone creates some distraction from typing "ls -xyztv" on yet another computer that supports portable code!

Demo coders: GO FOR IT! AND MY THANKS FOR YOUR EFFORTS!

Roy C. Gosewehr

Time to add my tuppence on the subject of Demos are bad programming practice. So what?

I think all those who flame demo coders are totally missing the point. I'll take the painting analogy one step further. If demos are paintings then compilers, etc. are like a hard-wearing exterior wood preserver. Yes, its useful and has a purpose. Yes, it takes a lot more knowledge of chemistry to develop such coatings as opposed to just using paints for art.

But a painting is art... hand crafted with attention to every detail. OK, so you cant reproduce the painting on any surface consistantly... but does that mean you shouldnt paint?

I have written the odd demo screen (and my hardware scroll Tetris - its a gas. See it in the Total Apathy (:-) Demo by the Bad Brew Crew whenever Andy gets off his butt and fixes the menu - Ok, Andy? :-) But I am more comfortable programming in C under Unix (my latest hobby project is 10,000+ lines of a multiuser game - fully self extensible, with its own LISP language and a full Telnet interface). The two are patently different activities. I'd like to know HOW I could use my 'bad' programming practices picked up from demo coding (eg. using iterated code segements rather than loops, counting clock cycles for exact fullscreen demo timings, self-mod code for .MOD players, hitting the hardware without opening /dev/hware_registers [sic])??? I know C pretty damn well, but I cant see how I can instruct the compiler to produce demo-esque code without hacking the assembly output afterwards.

As for 'demos arent portable' - neither is my ST :-) Demo's should be considered Visual Performance Art. They stand as they are. They mean no more and no less than how they look and sound. Someone earlier said demos are a form of multimedia. Exactly.

I would say that demos REQUIRE bad programming practices. I WOULD NOT say that they encourage them in any other form of coding. Cope.

>BTW, I use "solid techniques" when I don't write demos.

In your original post, it was the all the Demo-Hacks that you were attempting to glorify, and not solid programming. That is what I and others have taken exception to. Here, your just agreeing with us that solid programming is much more important; demos may be fun, impressive, or even artistic, but keep them in perspective. I would think that your original post has done a lot of demo-programmers a disservice by presenting them as conceited and juvenile. I prefer to think that at least some of them are just having fun and don't waste a lot of time pumping themselves up.

I think it should be possible to do so, since there is no difference for the Deskjet, whether your files are printed from the DOS-Emulator or the normal ST mode...

> 2. If so, can I use my msdos fonts?
If the fonts are simple, ready to use files, which are only to be sent to the printer, then there should be no problem at all.

>I figured I might do this in WordPerfect for the ST, but maybe
>there's some other program that might work this way? Is there
>such a thing as a softfont downloader for the ST?
Look in atari.archive.umich.edu, there is a directory (I think) /atari/printing in which you'll find a few files (hp*.arc). These contain different tools for the LaserJet/Deskjet series, including a softfont program. Also Idealist 3.105 (I think it's also on a.a, if not mail me) might use softfonts. The last program I know is the Laserjet printer-driver of cs-TeX for the Atari ST.

But I have a question on that, too. I have also bought an 256KB-Softfont cartridge, but I cannot get it to work properly with any programs. So if someone has a succesfully working ST-program to download a softfont into the Deskjet and do the rest setup (setting Lines per inch,...), could you be so kind and mail me (perhabs mailing me the program later)!

yours,
Benedikt

1913. Update on NCSA Telnet/SLIP usage

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 19:17:20 UTC
From: wmagro@uiuc.edu
Message-ID: <1992Feb25.191720.12805@ux1.cso.uiuc.edu>
Source record: 225392

For those who are using the telnet about which I posted yesterday,
here is what may be a fix. When I dial into my slip connection
and then telnet to certain machines, if I type a file which is larger
than a few kilobytes, the screen (and connection) sometimes hangs.

I believe the problem is that the remote computer is sending packets
which are larger than the slip driver can handle. When negotiating
a connection, the local and remote telnets each tell the other what
the maximum segment they can receive is. I believe that the config.tel
files that come with telnet.hqx have this value set too high, leading
to many resent packets, but no on screen response.

A value of maxseg=900 seems to have fixed the problem for me. A value
of 1024 definitely does not work. The correct value of course sits
between these. If someone does find the perfect value, please post.

As an example of this problem, telnet to 147.225.1.2 and log in as archie.
From a normal internet site you get a banner message and a prompt.
From NCSATelnet/SLIP (with maxseg set too high) you get the first line
and then the connection hangs. At least that is what happens to me.

I can't seem to get into the file server (atari.archive or whatever it's called) here on MIDILINE. What do I type in, on what line, at what time?

Does MIDILINE support files, or...?

Jared

1915. Gcc & G++ binaries

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 19:28:35 UTC
From: mcmahan@fletcher.cs.unca.edu
Message-ID: <1992Feb25.192835.20156@rock.concert.net>
Source record: 225390

After getting a hard drive, I wanted to get gcc and especially
g++ working on my atari.

Once I downloaded the binaries (thank god for ethernet PCs and
the fact the arati can read IBM disks!!!!), I tried to get them
working, and all I got was negative numbers for a status after the
programs bombed. :)

Can someone tell me:

1) what files besides the binaries are needed (I got the include files and
libraries, but...)

2) where to *put* the files so gcc and g++ can locate them...

3) what the extension .olb means (archived object modules?)

The binaries I got were from the umich archive, which is GREAT --
I urge everyone to support it!

Hi there!!

I know that this might be the wrong place to write a article
about the Atari TT, but, this is the only meeting, where I
have heard it being mentioned.

Well, to save time & money, I will get to the point :

I just wan't to get in touch with other TT users, so we can
exchange information, knowledge, and PD/ShareWare programs!

I've not got my TT yet, because, delivery time here in sweden
is x months, but, It would be nice, to have some nice stuff to
run on it, when .. I get it!

So, keep in touch!

1917. gulam -- the best shell

Newsgroup: comp.sys.atari.st
Date: 1992-02-25 19:35:31 UTC
From: mcmahan@fletcher.cs.unca.edu
Message-ID: <1992Feb25.193531.20282@rock.concert.net>
Source record: 225391

First of all, I refuse to take anyone seriously who *wants* a
MS DOS emulation for the ST.

Otherwise, GULAM has a lot going for it.

The utilities, like ls, cd, etc. are *built in* which means there's
no disk access time, loading the files into memory, and execution time
involved when you run the programs.

This is the biggest feature for me.

It has all the loops, etc. of other shells, which allows you to
write programs. I haven't figured out anyhting to write programs for yet...
It's almost exactly like UNIX.

It also has ue *built in*, which allows a very primitive job control
of either running or suspending ue...ue is very fast, since it's already
in memory.

Gulam also has a terminal emulator built in, but it's really crummy.

Shells like bas & tcsh are too big -- my ST really didn't like
bash & tcsh (it ran the korn shell, but what's a korn shell? :))
when I tired them. My st didn't like MINIX much, either :)

If someone came out with a smaller, more flexible tcsh for the st
with commands built in, I'd be the first to try it, but until then
I'll stick with gulam.

> bad, as it a very quick and powerful program, once you get accustomed
> to its interface.

Yeah, it's also too bad that Paul Heckel took a lot of people's money in advance for Zoomracks III, made a lot of promises, then spent the money on something else, and said, 'sorry, no Zoomracks III'.

He did a lot of weeping and moaning about Quickview's terrible financial situation when I talked to him by phone a few years back, basically explaining why he couldn't produce a v.III, nor refund anybody's money. Of course, when he got all that money from Apple after he sued them for patent infringements, he didn't refund any money either.

In my opinion, Zoomracks was an interesting program that had lots of potential and some unique ideas, but was rather buggy (both I and II crashed on me a lot). And considering the fact that the guy wrote the book on user interface design (well, *a* book :-), Zoomracks has got what I consider to be one of the most god-awful user interfaces on the planet.

Even though he can't provide a product, nor refund money, I'd advise against anyone attempting to use any of the interface ideas to produce their own 'zoomracks-like' database, since Paul seems to have more than enough money for lawyers and lawsuits.

In <6116@lee.SEAS.UCLA.EDU>, Scott Willingham writes:

>Hacks are just that, hacks. They will be obsolete whenever the hardware or
>system software changes.

Well, once upon a time, the best programmers used to be called hackers.
Of course, this was before the advent of the Church of the Structured
program. I have a few freinds who program for a local games company, DSI,
producer of Test Drives I & II, 4d Racing, 4d Boxing, etc. Guess what they
do for amusement between projects? You got it, code demos. Almost all of
them started out as demo programmers. As they have very good paying jobs,
with stock bonus's and the company was recently purchased by Electronic
Arts, I can't see how demo coding hurt their careers.
Also, while the anti-demo guys have some argument in that there will
always be a need for those who can contribute structured portable code
for large projects, there will also continue to be a need for those who
can code tightly, taking advantage of every instruction saving trick to
fit the most possible into into small imbedded applications.
In other words, there's still room for people who enjoy hacking, Just
because, as one poster put it, the demo coders are specialists in some
obselete vidio display hardware, doesn't mean that this knowledge won't
translate to some other state of the art video hardware. Who do you think
worked out the ways around the idiotic IBM display standard interface to
write directly to the graphics hardware?

On the issue of demo programming, I have a few things to say:
First, demo programming is more of an art form using the ST as a medium than anything else. The spirit of demo programming is to be as creative as you can with the medium. It is not an issue of whether or not they use the best programming techniques. Arguing that they should write code in a portable language misses the whole point - it isn't possible to do these type of demos in C on the ST. I think some of these people criticizing demo programmers have been so immersed in technical work (maybe isolated in front of a computer screen) that they can no longer enjoy the aesthetic quality of things. I hate to see that even more than bad programming.

> STs that were bought in Norway.

Really? That skilled? I'm impressed. Pity they don't put it into practice more often. You don't seem to realise that once you start making assumptions about what lies beneath the surface of the OS, or relying on side effects of the hardware, you're code becomes inherently non-portable, and seriously so.

> What the hell has compilers to do with anything. We were talking
> demos here!!!

Actually, I believe were talking about good programming practice, a field which encompasses systems tools, games, you name it. I've seen demos running on several different ST versions, and demos doing the same thing that fall apart on some machines. Why should this be? Because the writers of the first demo were aware that things change, and have consequently limited the assumptions they make. Remember, the time taken to verify whether the things you need are present is minimal compared to the time taken to load the code from disk. A few simple checks and compensations on startup can vastly improve your demos portability.

> Have you EVER seen a good demo? To write portable system tools
> you need to know something about many machins while when writing
> demos you need to know everything about one machine. Correct me

No, not true at all. To write portable anything, you need to understand what makes code portable.

> Neither do I! And hey, I'm NOT "the master of obsolete video hardware".
That's a shame - perhaps if you work at it you might some day be a master.

> If you're so famous and good at programming, how come I've never
> heard of you. Could it be because you aren't famous?
Wow, could be! Wake up - you're never going to get famous programming computers. The world unfortunately hasn't recognised us as the elite we are. OTOH, you could certainly get to be overpaid 8-)

> More like a SUN 3/70!!!

That was sarcasm, right? Have you ever used a Sun 3?

Well spotted, that's exactly the problem. There's no reason why a program should fail when the operating system changes. Who's fault is it when they do? Incidentally, there's no such thing as 'strange new Tos versions' - all the Tos revisions that have been released improve upon, and fix bugs from, their predecessors (OK, some of them introduce new ones, but WTF 8-)

BTW, no-one's trying to stop people writing demos - let face it, if you they don't interest you, you don't have to run them. What needs to be made clear is that bad coding shouldn't go any further than demos - whether its a 500 pound database or a 25 pound game, you should be able to rely on it to work across OS revisions.

Others people have asked this. Others have ask how to set up MiNT,
or MGR, TeX, or other suites.

What we need is documentation for these things, written by people
who have succeeded, and have the docs with the files. Sounds like
something that sound be done already - but it isn't for many of
the _suites_ of programs.

Let's find out the fate of the archives first though...

After a month of anticipating this episode (Tue, Feb 25) of Computer Chronicles on PBS, I have to say that I was disappointed by the coverage Atari received at NAMM.

The Atari/NAMM segment barely lasted 2 minutes and 40 seconds (half hour show). The segment 'featured' a very brief mention of Atari's new Music Divison, and mini-peaks at some 3rd party Atari based pacakgaes (Notator, Digital Master Workstation, Hotz Midi Translator, and Cubase). With two small interviews with Mike Pinder (Moody Blues) and Mick Fleetwood (Fleetwood Mac), that was the whole segment. The only thing mentioned on Atari hardware was it being the only computer on the market with built in MIDI interfaces.

This entire Computer Chronicles show was dedicated to MIDI music. So what did the rest of the show feature? A short look at some computer/music research occurring at Stanford; four in-studio guests demonstrating MIDI packages on Amiga, MS-DOS, and Mac platforms (no Atari); and the weekly 'Random Access' segment.

Very disappointing show, especially considering that the NAMM correspondant even refered to Atari as being "long the musicians' favorite."

Oh well. Guess this is already more coverage than Atari usually gets in the States....

Unplug your printer. G2 thinks the extra joystick fire button is pressed and
so creates the player.

Well has it ever occured to you that some people may use their computer
to have some fun too?? Why do you say that those people are wasting their
time??
In case you don't know, many of those demo-programmers (with "a juvenile
mentality"!!) are also programming for big companies. Successfully, that is!
And before you claim that "this sort of hacking is no use whatsoever in the
real world" you should perhaps look at some demos first!!
The fastest 3d-routines and fractal routines for example have been written
by hackers. And even more important, (if this is true, at least in the TOS
magazine someone said so (I think Flix of DF)), the overscan hardware (which
allows resolutions up to 752x512 (a guess...) or so was based on the "useless"
no-border routines...

Format a 720 kbyte disc on the PC. The ST will be able to read and
write to it, as will the PC. I think that recent ST TOS versions
do have completely PC compatible formatting - although 1.44MB discs
are a different question.

Most and if not all Amiga shops here in Wellington have closed, and
the Amiga here is cheaper, the only thing that is selling sport of is PC
clones and they are very cheap here...

I would like to see a Amiga do what Calamus can do with a Standard A500
or even a A500 +, shops here don't like selling the A500 + as no games
will work on it..

Even a Amiga dealer quoted to me that a ST/E was far better for DTP
and MIDI than any A500 or Plus, you nead to many add ons to make the A500
to work and the A500 + neads a Multi-sync monitor...

Funny thing that I dnloaded a game from A.A. I don't remember at the moment
but that had the same problems, Arc 6,02 would not work, I ended up useing
some old arc thing, I will post later what it was and the game
that caused the problem...

kebab@cix.compulink.co.uk (Kevin Donovan) writes:
:
: m91der@uunet.uu.net (Daniel Eriksson) writes:
: > I can't speak for every
: > demo-programmer in the world, but I know that the people I
: > know are so skilled that they can tell the differance between
: > a portable routine and a routine that only works on 4 years old
: > STs that were bought in Norway.
:
: Really? That skilled? I'm impressed. Pity they don't put it into practice
: more often. You don't seem to realise that once you start making assumptions
: about what lies beneath the surface of the OS, or relying on side effects
: of the hardware, you're code becomes inherently non-portable, and seriously
: so.

But you miss the point of todays ST(E)-demos. The point is to push
the machines to the absolute limit of what they can perform. To
use the OS to do such things would be, to say the least, STUPID.
When I'm writing demos for the ST(E) I'm aware that the demos won't
work on a TT, but I don't want them to work on a TT! If my demos
would work on a TT they wouldn't be real demos because they wouldn't
push the TT-hardware to the limit. Get the point?

On the other hand, you are VERY correct when you say that side-effects
is dangerous to use. But I calculate the danger and if I find that
the dirty trick will work on enough computers I use it. When I'm
writing applications I can't rely on any side-effects, AND I KNOW IT!

: > What the hell has compilers to do with anything. We were talking
: > demos here!!!
:
: Actually, I believe were talking about good programming practice, a field
: which encompasses systems tools, games, you name it. I've seen demos
: running on several different ST versions, and demos doing the same thing
: that fall apart on some machines. Why should this be? Because the writers of
: the first demo were aware that things change, and have consequently limited
: the assumptions they make. Remember, the time taken to verify whether the
: things you need are present is minimal compared to the time taken to load
: the code from disk. A few simple checks and compensations on startup can
: vastly improve your demos portability.

True, but I can clearly see that you've never made a demo that
uses the really dirty tricks. The problem with removing borders
and tricks like that is that no one knows how many different
timing-differances between different video-chips there are. And

you can't test your routine on every single ST(E) all around
the world.

: > Have you EVER seen a good demo? To write portable system tools
: > you need to know something about many machins while when writing
: > demos you need to know everything about one machine. Correct me
:
: No, not true at all. To write portable anything, you need to understand
: what makes code portable.

True, but you also need to know "something about many machins"!

: > Neither do I! And hey, I'm NOT "the master of obsolete video hardware".
: That's a shame - perhaps if you work at it you might some day be a master.

You're really funny, do you know that?

: > If you're so famous and good at programming, how come I've never
: > heard of you. Could it be because you aren't famous?
: Wow, could be! Wake up - you're never going to get famous programming
: computers. The world unfortunately hasn't recognised us as the elite we
: are. OTOH, you could certainly get to be overpaid 8-)

True AND untrue. You could never get famous in the 'real' world. But
among hackers and programmers you could get quite famous.

: > More like a SUN 3/70!!!
:
: That was sarcasm, right? Have you ever used a Sun 3?

I'm writing this letter on an Atari Mega STE connected with a
modem to a SUN 3/70. And when at school I use SPARCstations
to connect to the SUN 3/70. NO JOKE!

Well, you must be a bit narrow-minded. You must understand that
a hack doesn't need to be unreliable or unportable. You clearly
don't know what 'hack' means. Look it up in a JARGON-file or
a FAQ-file.

>about the ST(E) and how to control it to gain maximum speed
>when manipulating graphichs and calculating things.

It may be true that you haven't said anything directly, (I think -- your original article has expired here) but you _implied_ that you were superior. You seem to have changed your tune in recent postings.

For example, what about "any self-respecting Atari or Amiga programmer is a member of a demo group"? (the quote is etched large in my memory). The implication here is that if we don't program demos, we somehow have no self respect. Is was this, IMHO, that played a large part in motivation for the original complaint about your posting.

> XE-Game System
>So this is where your Amiga comes from.

Guess that makes the Amiga the natural upgrade path for all the pre-Tramiel
Ataris owners.

Well, speaking as a former C-64 owner that upgraded to an Amiga. I don't
really think it matters what the inside contains. I stuck it out with C=
because Tramiel went over to Atari and I didn't like his stupid business
practices. Can one say Plus/4...that went the way of the PC-jrs. Also,
C= offered upgrade discounts for those with any C= computers so, naturally
I upgraded first chance I got.

I think that most people stick it out with companies that they brought
their original computer from out of a sense of loyalty or hoping for
something better to come along from the company. I figure that many Atari
owners stayed with Atari and upgraded to the ST while many C= owners stayed
with C= and upgraded to the Amiga.

I also think a great many Atari and C= computer owners abandoned ship and
went to the IBM or Mac.

This is all opinions, as I doubt anyone has hard facts as to where the
8-bit owners fled to.

: >removing borders!!!
: ...
: >BTW, I use "solid techniques" when I don't write demos.
:
: In your original post, it was the all the Demo-Hacks that you were
: attempting to glorify, and not solid programming. That is what I and
: others have taken exception to. Here, your just agreeing with us that
: solid programming is much more important; demos may be fun, impressive,
: or even artistic, but keep them in perspective.

I DO "keep them in perspective". And I still want to glorify demo-
programming. Not that it's to any big use to Atari-owners, but
it may attract buyers to the Atari. And to those who know how to
tell the differance between a nice hack and a dirty trick demo-
programming is a nice way to practice code-optimizing. Not to
mention how fun it is to write and watch demos!!!

: I would think that your
: original post has done a lot of demo-programmers a disservice by presenting
: them as conceited and juvenile.

Well, I can't tell what those narrow-minded professional programmers
(I'm NOT saying professional programmers are narrow-minded (but some
of them are REALLY narrow-minded)) think, but I think you're a bit
wrong.

: I prefer to think that at least some of
: them are just having fun and don't waste a lot of time pumping themselves
: up.
:
: -- Scott Willingham // willing@icsl.ucla.edu

Well, I must (unfortunately) tell you that many of the new crews
that are formed today only has one thing in mind, and that is to
pump themselves up. I'm not saying it's the same for all new demo-
crews, but if a new demo-crew want to become famous they really need
to be masters at dirty tricks or have something original to show

up. And since most things already has been done it's hard to come
up with something original.

: > Tos comes out.
:
: Well spotted, that's exactly the problem. There's no reason why a program
: should fail when the operating system changes. Who's fault is it when they
: do? Incidentally, there's no such thing as 'strange new Tos versions' - all
: the Tos revisions that have been released improve upon, and fix bugs from,
: their predecessors (OK, some of them introduce new ones, but WTF 8-)

Just a small correction: Applications may stop working because of
new TOS-versions, but most demos stop working because of new or
different hardware.

: BTW, no-one's trying to stop people writing demos - let face it, if you they
: don't interest you, you don't have to run them. What needs to be made clear
: is that bad coding shouldn't go any further than demos - whether its a
: 500 pound database or a 25 pound game, you should be able to rely on it to
: work across OS revisions.

Yeah!!! TRUE!

1949. Plot v1.68 uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 12:47:05 UTC
From: cordes@ac.dal.ca
Message-ID: <1992Feb26.084705.3811@ac.dal.ca>
Source record: 225330

New upload to the atari/new directory on atari.archive: PLOT168.ZOO

This is an upgrade to PLOT165.ZOO, which has been in the applications/math directory. The program is a 2D Function/Data plotter for high/medium resolution ST's. Works well on a Mega STE, but probably not on a TT (but maybe if the 24BIT program is run?). Some of its features are:

* Plots functions typed at the keyboard. Large range of function primitives to choose from, including the BesselJ function, the BesselI function, the Airy function (new in this version) and the Gamma function. Has a function history buffer. Very long function lines may be entered (more than 80 characters).

* Data (x-y coordinate pairs) can be entered in a simple editor or read from a file. Some data transformation and fitting capability is included.

* Multiple curves can be overlaid on the same plot. Text can also be added.

* Good quality hardcopy is possible via GDOS (GDOS drivers/fonts are not included).

* Various numerical utilities are built in, including an expression evaluator, numerical integration, finding zeros of functions (of any function entered at the keyboard) and complex roots of polynomials.

>

Needing to disconnect my printer before use will more than likely keep
Gauntlet 2 on my shelf.

There's nothing in the docs but does anyone know of a key combination
that the programmer might have included in the code that can be
pressed at program boot-up time to bypass the interrogation of the
printer port? I can't believe there isn't some way of bypassing this
check besides physically unplugging the printer.

>I believe DC Format from double click software will do it. Good Luck,

Why not just format the floppies on the PC? The ST can use 720K DOS
floppies as if they were formatted by TOS, no matter what version you have.

I agree that Gulam is a very fine shell, but it has some unpleasent features.
(Like a problem with command history.)

Can anybody tell me what the latest version of Gulam is, anyway.
Mine is dated somewhere is '88.

Reply-To: harry@issun1.kfk.de
Organization: Kernforschungszentrum Karlsruhe
Subject: Trouble with Signum!2 & HP DeskJet
Keywords:

Hi everybody,

a friend of mine has fixed a HP DeskJet 500 to his 1040ST and now has problems with Signum!2.

1. If the printer has just been switched on, it isn't responding to printing requests. When I pulled out the parallel cable and plugged it in again while the ST was hanging, it started to print. Are there known problems in the timing of the Centronics interface between a ST and a DeskJet?

2. After printing the first page of a multipage document, the printer just ejects empty pages, looks like doing formfeeds for eternity.

For detail: He is using Signum!2 V2.01 and the PR30L V2.02.

Perhaps my friend has some hardware problems with the parallel port..., I don't know.

So, if you have or have had (and solved) similiar problems with the same hardware configuration,
please answer. And if you use the same hardware without any problems, I am also interested to know this.

Please email answers to me, because usually I am not reading this newsgroup.

Thanks in advance

Harald

1956. How to reach author of POOLFIX3

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 14:56:41 UTC
From: alexlehm@iti.informatik.th-darmstadt.de
Message-ID: <1992Feb26.145641.32603@infoserver.th-darmstadt.de>
Source record: 225336

I got the program POOLFIX3 with the distribution 1.21 of GEMINI shell.
Trying to use it on my ST, the program failed to run, due to the presence
of CBHD, the harddisk-driver by Claus Brod (Scheibenkleister), which
hooks into the TRAP 1 vector. I fixed this problem by reassembling the code
and have inserted some stuff to go through the XBRA chain, to find the original
ROM entry of TRAP 1. This now works perfectly and I want to make the fix
available to other users with the same problem.

Since I don't know, if I am allowed to distribute this program in modificated
form, I think it might be best that the original author includes this fix in
the normal distribution of POOLFIX.
I don't have the name, since it wasn't in the README file, but if anybody
knows who is the author, if s/he has email, or may even reads this group,
I am thankful for any suggestions or leads.

Thank you in advance ... Alexander Lehmann

Source record: 225335
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

This is a bulletproof, full-height, not super-fast basic MFM Hard drive.

Don't buy this if you want the latest and greatest speed deamon, or some super-quiet very compact disk drive. We are talking 6 or 7 year old technology here! Basic Hard-drive, intended for the do-it-yourselfer, who wants a drive but doesn't have a lot of money.

I used it in and external HD case that had its own power-supply.

I used it to make my own "Home-Brew" Atari-ST HD set up, controlled by an ICD adaptor and Adaptec controller. I have SOLD everything but the drive mech (I upgraded to a larger drive and then sold my Atari System).

The drive has lots of Atari Stuff still on it.

Asking $60.00, you pay shipping charges. I am asking 2X the going price for dead HD mechs, cuz this thing worked last time I spun it up, and it should work fine for you, but no guarantees.

1961. GNUPLOT for Atari

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 16:31:50 UTC
From: alexlehm@iti.informatik.th-darmstadt.de
Message-ID: <1992Feb26.163150.30345@infoserver.th-darmstadt.de>
Source record: 225340

Hi everybody,
if you are interested in displaying functions, you may want to check out
the Atari port of GNUPLOT 3.0, which I just made FTP able on 3 sites.

If you haven't heard of GNUPLOT before, maybe this sums it up:

- FreeWare (not GNU licence)
- plots 2- and 3-dimensional functions
- plots parametric fuctions
- plots data files
- supports LOTS of different output devices like:
Atari Screens (obviously)
Epson, NEC, Star printers
HP, Kyocera etc. Laserprinters
various plotters
LaTeX

The Atari version is in some kind of beta stage i.e. nobody except me has
used it until now, but I am fairly confident.
At present, the distribution includes only the necessary files including
binaries, the sources are available from the standard GNUPLOT distribution
sites.

The file (Zoo 1 archive) is (or should be) available at the following FTP sites:

biome.bio.ns.ca filename /pub/atari-st/gnuplotST.zoo
atari.archive.umich.edu /pub/gnuplot.zoo, should move to proper dir
ftp.informatik.rwth.aachen.de /tmp/gnuplot.zoo, should move to proper dir

login in as ftp and don't forget the BINARY mode.

Feel free to mail about any comments/bugs.

bye ... Alexander Lehmann

1962. deja-vu games don't work under Tos 2.06

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 16:36:38 UTC
From: dba@jet.uk
Message-ID: <1992Feb26.163638.9517@jet.uk>
Source record: 225255

First the bad news:
The first victims of Tos 2.06 are Bloodwych and WWF wresling which don't run.
Out of my 4 full priced original games 2 won't run!.

The only serious software problem I have noticed so far is a calendar acc
which now has a delay of 8 seconds or so, after clicking on the scrollbar
before it reacts, moving the bar works perfectly.

The RTS CTS bug still exists as far as I can determine. I have an intelligent
EPROM programmer connected to the serial port which still only works with a
delay loop in software when sending data.

The good news:
All the serious software I use runs well, First Word Plus V3.20,
Lattice C v5.6.2, Gulam, MicroEmacs are all ok.

Source record: 225254

Hi y'all...

Looks like I stirred up a bit of interest about catching finger
commands....

Look... I am in a highy dodgy position here. Our organisation
is very particular about information we give out. We only have posting
privelidges on certain groups, and could lose that if we 'abuse' by their
definition, the Net.

Now, I *do* have two little programs, which, when combined and run
will greet people using 'finger' by their real; name. This is done by
altering the .plan file with information about themselves. Every finger
is logged also.

The down side is that the process is *very* processor intensive,
and affects the machine performance. If I give out this information (I
thought it up myself, and coded it so you probably can too), then if
a load of irate superusers mail our admin saying 'we are all running systems
like treacle because of what one of your users gave out' I will get stomped
on very hard. And I dont want that.

Mail me with your views. If you want it bad enough, then let me know.
If I get enough reponse, THEN I will *ask* our admin guy if its OK to give it
out. He's a decent guy, so lets see....

1965. Oops! FCOPY3 Streamer fails!!!

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 17:14:12 UTC
From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Feb26.131412.1@vaxr.sscl.uwo.ca>
Source record: 225342

Has anyone ever tried using the hard disk streamer in FCOPY3 (a rather excellent PD formatter)??? I recently tried it out and got some strange and entirely intermittent problems:
1) when restoring the data to the drive the program sometimes wrote to to the drive when the buffer filled and sometimes it didn't!
2) when it DID write the files back to the drive the runnable progs (.PRG, .APP, .TOS etc.) would NOT run...I simply got 2 bombs and back to the desktop! The .INF, .CFG etc. files seemed fine though...weird eh!

Has anyone ever had a similar problem and if so...WHAT DID YOU DO?

Possible help in diagnosing: The ONE time I did get the data to write back to the drive was when I ran FCOPY3 as a PRG and not as an accessory (as I normally do). As stated this only worked ONCE and has not worked since!

Don't get me wrong, I think FCOPY3 is a *GREAT* program, especially the speed with which it formats (about 5 secs. for a previously formatted disk or about half the time of a regular format if the disk is new), but this appears to be a MAJOR glitch! I'm just glad I didn't use it to save all my stuff before reformatting my hard drive...boy would I have been peeved!

Thanks in advance for any help etc.,
JR.

You see lots of things presented on fairs, I know. The programmer can even
make a pre-alpha release doing what he wants to show. But seriously, I'd
like to know if anyone _bought_ the Mega*Talk board and had made some
experiences. BTW: STalk works! :-)

1970. *Full* colour ANSI (inc Graphics) Comms Program???

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 19:06:58 UTC
From: shore@equinox.gen.nz
Message-ID: <BymRgB3w164w@equinox.gen.nz>
Source record: 225277

Has anyone ever heard of a Full colour ANSI comms program for the ST?
(with the ANSI character set)

I've only seen, at the best, 4 colour ones.

Why? Probably because you need 80 columns with 16 colours, the ST only
gives you 4 colours in 80 column mode :-(

So is there one available? If so, i'd love a copy.

If there isn't, how about some of you Demo crews writing one for me! :-)

Craig.

1971. Re: CALAMUS/DESKJET INFO NEEDED

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 19:48:03 UTC
From: ross@BEIZ.mediatex.ch
Message-ID: <29abeef4.8c73dc.1@BEIZ.mediatex.ch>
Source record: 225264

no address?!

With my Deskjet, it takes ca. 2 Minutes
to print the printer.cdk-testdocument
with a mix of high-res. graphics and
different sizes of tilted text etc.
So probably it is your printer, that
is slow. However, i had in my old
Calamus 1.09 NOT 1.09N a much slower
printer-driver, that took ca. 11 Min.
The new one is with my Stacy almost as
fast (2 Min.) as the TT (1.30'), So it
seems that Calamus is driving the prin-
ter to its limits even with a normal
ST (almost)
Hope i helped?!

Yes, indeed it has these features, which I certainly appreciate (especially the filename completion) but for those people like the person who originally started this thread and are more used to MS-Dos type shells, I'm not sure that these advantages are worth the learning curve. PCommand is ok, if a little unstable, but if you have a hard drive (I don't) buy NeoDesk and its CLI. Definitely.

1040STe and Software For Sale

Atari 1040STe system (under 40 hours of use, and back in the box)

- Mouse, system disk, User manuals
- Owner's Registration card
- Original packing

I got this system for my kids about 6 months ago but they don't like it

Asking $325.00

Programs
Kidprogs - $15 ($27.00 new)
N-VISION ' A professional paint program' -$10 ($19 new)

Take it all for $335 (I will split UPS ground shipping from NH)

Send E-mail or
Call

There are of course DEMO's on PC's and MAC's, you just have too look.
Some are quite impressive, and technically quite a bit superior
as some of them require 24bit color NuBUS, EISA display cards.

Hello, fellow netters, this is the first time I've ever posted, but
anyways, I have a few questions I would like to have answered:

1) Does Knightmare (A game by the folks who did Captive) work for the
Mega/STe?
2) Could someone please upload the patches to convert STalker 3.00 to
version 3.01, via e-mail or otherwise? I don't have access to either
Genie nor Compuserve.
3) Could someone please tell me how to set up a workable, with tcsh,
Mint/MGR combination? I believe I am rapidly getting lost in the
documentation and stuff.

Finally, I am interested in a plain generic 1040STf with TOS 1.0 and with
a mouse for approximately $200, so if you have one up for sale and it
works okay, then please e-mail me.

1976. AT-Speed C16 problems (Help!)

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 22:03:56 UTC
From: dtarico@misvax.mis.arizona.edu
Message-ID: <1992Feb26.150356.1@misvax.mis.arizona.edu>
Source record: 225271

When I run Norton SI on my AT-Speed, random sopts of color show up on the screen. (It is the AT SPeed c-16). I tried it on 3 different machines and got the same result. Has anybody else seen this problem, or is it normal? Also, on my Mega ST, it seems to be crash prone. I was not able to put a socket directly on the cpu inside the mega because I have an internal hard drive mounting. So I solder about 3 inches of flat cable to each side of the 68000 and soldered a socket on top of that and pluggend the AT-Speed in there. I soldered carefully, and checked for bad connections or shorts. Is there any reason that this extension would cause problems (assuming it is connected properly? Anyway, I get the strange behavior from Norton on any machine, but the outright crashing seems to happen more on my mega. Also, when the AT-Speed is plugged in, it messes up my ST screensaver while in ST mode. If I unplug the AT-Speed from the socket, then the screensaver is back to normal. Does anybody have any idea what the source of these problems might be? Faulty AT-Speed and/or instalation? Any help would be appreciated. Thanks!

Is there an FTP site other than atari.archive which contains some of
these demos?

-sme4v@uva.pcmail.virginia.edu

1978. RE: >>>READ THIS DEATH OF ATARI.ARCHIVE.UMICH.EDU<<<

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 22:33:40 UTC
From: johnbarnes@enh.nist.gov
Message-ID: <26FEB92.17334099@enh.nist.gov>
Source record: 225266

BobRetelle has hit on a very valid point. THe hardware that supports these archives and the maintenance of this hardware is anything but "free".

The atari.archive guys have done a truly ouytstanding job over the years. Theirs is not the only ftp site for atari stuff, but it is probably the best one.

I suggest that the community take a lose look at the whole picture of atrai archive sites and identify one of the existing ones as the successor to terminator.umich.edu. Care should then be taken to enusre that the chosen site exists in an environment that is likely to assure continued support. THe contents of the chosen site should be augmented by those parts of the umich archive that it does not yet have.

The community wil lphave to provide for itself in thgis matter. Unfortunately there are only a small number of people in the community who are used to taking an active role in protewcting their own interests. Too many of us have been content to "let Atari do it" when we should have been figuring out ways to handle the job without Atari.

The most recent discussion on this seems to indicate that no amount of letter writing will solve the problem, and that it is time to put on our life jackets and make sure that the holes in the lifeboat are plugged.

John Barnes

1979. Re: why do I only get 512k on a 1040

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 22:36:41 UTC

Gregg,

One thing I would check before taking the machine anywhere is that both the MMU and the GLU chip (the two square chips) are making good contact with
their sockets. Try just pushing them down into their sockets to reseat them.
I have encountered machines with all kinds of symptoms due to this, but if
this is not the problem, I would guess you have a bad ram chip in the higher
bank of ram.

1981. Hot Rumors

Newsgroup: comp.sys.atari.st
Date: 1992-02-26 23:59:08 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1992Feb26.235908.25023@CS.ORST.EDU>
Source record: 225272

It's a nice sunny day here, so I thought I'd make the hour-long drive to my favorite Atari dealer. After purchasing a pair of joysticks, we got into a little discussion about what to look for in the coming months. The guy I was speaking with is usually very candid and isn't the kind who would feed his customers a bunch of BS.

The TT040 is supposed to debut in April. Shipping dates are supposed to follow closely. He says Atari Corp is being very hush-hush about performance statistics, but there seems to be a lot of excitement brewing over this machine's capabilities. Supposedly the machines will be ready to go right after the show, as opposed the year or so it took the TT030 to become available.

My dealer says that the STBook will be on his shelf shortly (week or two). The machines are being packed and prepared for shipping right now.

Goldleaf publishing has ported Retouche and Didot Line Art to the NeXT. However, for some reason (OS overhead?) it took 'forever' to produce output on certain devices. (I forget which devices he said, linotype or photo-typesetter or something like that) so there will be an optional black-box 'accelerator' sold along with Retouche and Didot. You guessed it. A TT motherboard in a non-descript black box with a couple of cables hanging out of it.

Atari is supposedly working on expanding their line of '386 based ABC computers. But who cares.

All of the above is second hand information, I take no responsibility for its truth (but I have quite a bit of faith in the guy I heard it from).

Here's hoping,

mjl-b@minster.york.ac.uk writes:

:[stuff deleted]

: >:A good appreciation of algorithm design would make you a better programmer,
: >
: >True! But who are you to decide if I like algorithms or not?
:
: Errr... what? If you thought I was trying to force you to do something, then
: I apologise. I just thought I was stating a widely-held belief!

Well, I didn't think you were either. But who ever said I didn't
appreciate (sp?) good algorithm design? That was what I reacted upon!

: You don't have to take my advice, of course. The choice is all yours, but I'd
: like to see your rationale for _not_ liking algorithms!

My choice is to keep coding demos that use dirty tricks in my
spare time!!! This does NOT mean I don't like to code other
things (like applications). The differance between a dirty
trick and a portable application is like day and night, and
as far as I know I'm still able to tell the differance
between day and night ;-)

: >Have I ever said that I don't appreciate a nice portable
: >application or a clever "algorithm design"?
:
: No, but since you've slagged off your opponents for suggesting that there might
: be other motivations in programming other than writing the fastest code ever...

You must have misunderstood me completely. I'd better start
taking courses in english so guys like you can understand me
(writing in swedish wouldn't make things much better ;-).

What this is all about is that some narrow-minded guys started
to flame some guys discussing demos. I've never said (or implied)
that writing the fastest code should be the only motivation for
programming. What I might have said (or implied) is that writing
the fastest code is one VERY important motivation for continuing
writing demos.

: >: as would losing the juvenile attitude.
: >
: >Hey, who's having an attitude? Learn to read before you flame
: >me again!
:
: Suggesting that someone is jealous of the fact that you can write fast code

: says something about the way you think. If you can't see the problem, then
: there is little that I can do to explain it to you.

Hey, I've never said *I* could write faster code than him (is it
my bad enlish or your eyes that has f*ucked it up for you?)! It
might have been a bad choice of words, but I couldn't think of
a better way to express what I meant. Unfortunately most people
(including YOU) misunderstood the whole sentence and thought I
meant that I could write faster code than him. I have NO idea of
if I write faster code than him or not since I've NEVER seen any
of his code.

Once again I must beg you to learn to read before you flame me!

: >: I like demos -- they're fun -- but they're not really useful. What annoys
: >: me, certainly, is the "Demo programmers are the greatest that ever walked
: >: the earth, and I'm one of them" attitude.
: >
: >Do you really think I've got that attitude? You are true when
: >you say that demos aren't very useful, BUT they can be of
: >some use if they are shown in shop-windows or if someone
: >after seeing a demo runs home and orders a copy of Devpac
: >or some other assembler (to try to learn 680x0).
: >
: >I admit that I'm proud of beeing a member of a famous demo-group,
: >but have I ever said that we (or I) are better than some other
: >professional programmers? What I might have said is that we are
: >better than some other demo-groups (and that's not only my own
: >opinion). And when I say 'better' I mean that we know more
: >about the ST(E) and how to control it to gain maximum speed
: >when manipulating graphichs and calculating things.
:
: It may be true that you haven't said anything directly, (I think -- your
: original article has expired here) but you _implied_ that you were superior.

Please go back and read some of the letters. You will see that
I DON'T say (or imply) that I'm superior. What I said (and implied)
was that we (my demo-crew) are better at controlling and programming
the ST(E) than some other demo-crews. And I can in no way compare
the demos we make with applications. That would be like comparing
a vacum-cleaner and Sparcstation ;-)

I also wrote somewhere that I had seen some code by professional
programmers that could have run twice as fast and still be as
portable as it was. Is that to imply that I'm superior?????????

: You seem to have changed your tune in recent postings.

I don't think I've changed my tune, but that's not up to me
to tell.

: For example, what about "any self-respecting Atari or Amiga programmer is a
: member of a demo group"? (the quote is etched large in my memory).

VERY bad choice of words from me! SORRY!

: The
: implication here is that if we don't program demos, we somehow have no self
: respect.

If you check out some other letter in this thread you'll see
that I explain what I mean with the (bad) sentence. It turns
out that I DON'T really mean what I wrote. I forgot to
explain that when I wrote "Every" I didn't really mean EVERY.

: Is was this, IMHO, that played a large part in motivation for the
: original complaint about your posting.

You are (unfortunately) right! But then again, everybody
has the right to make an error -- once (or maybe twice)!

Hello there,

Two questions that need answering by those in the know:

1) Can somebody point me to a ST PD Pascal Compiler that I can FTP.

2) Can somebody post instructions on how to connect a standard IBM
compatible Hard Disk to an ST? Please include any custom hardware
that is required to be built/purchased...

Thanx in advance
Dennis Remmer
(dennis@citr.uq.oz.au)

1987. Atari and T.O.S and S.T. : Tramiel perversion or something else ?...

Newsgroup: comp.sys.atari.st
Date: 1992-02-27 05:09:53 UTC
From: janin@v785.stanley.co.jp
Message-ID: <8442@v785.stanley.co.jp>
Source record: 225278

Just a question : does "TOS" really mean "Tramiel Op. Sys." or not ?
Many users, from all ages and tendencies, still wonder about it...
If the answer is "yes", is it purely a Tramiel megalomania phenomenon
(^_^) or is there another serious reason ?
If the answer is "no", can you give me the right reading of those
strange three letters ?

Ha, the last one : what about "ST" itself ? "Super Tramiel" ?... (^_^)

No friend of mine, even ST users themselves !, could reply me.
I tried myself to find a correlation between TOS/ST and Atari names,
and failed.
If Atari gave a full name to their STs,
instead of strange capitals only,
I wouldn't have had to ask you for it !

Thanks.
You can E-mail me if you want...

1988. Re: 'Demo Crews'

Newsgroup: comp.sys.atari.st
Date: 1992-02-27 06:33:08 UTC
From: towns@atari.uucp
Message-ID: <1992Feb27.063308.4763@atari.uucp>
Source record: 225294

mro@dcs.exeter.ac.uk (Marcus) writes:
| All this talk of demo programmers not writing good code is a load of
|crap. As a (very bad) demo programmer myself, I have seen some very good code
|by some of Europe's better groups.

I don't know about the code, but they certainly know how to push video
and sound hardware to its limits.

| I don't think that people can slag off demos when they obviously don't
|know what they're talking about. It is true that a lot of the better games now
|are being written by demo programmers. Look at "Enchanted Land" by Thalion.
|This was written by the Carebears over a year ago. Show me any other game that
|has scrolling as smooth as this. Even Wayne "Can't Be Done" Smithson of "Blood
|Money" and "Anarchy" fame - who thinks his scrolling is good - comes nowhere
|near Niclas Thissel.

Now... let me ask you the ultimate question: Do these games you have
mentioned work on the STE, MegaSTE, or the TT? I wouldn't be surprised
if they didn't. See, this is the part of the demo crew thing that I
object to: These people write these cool demos, then real companies hire
them to develop games, the demo writers write games that cut corners,
I buy their games, they don't work on my TT, and I am out $40-50, etc.
I don't mind the demos, but it has been proven time and time again that
the cutting of corners taken by demo writers has made its way into the
games that I pay MONEY for. That is extremely bad. Worse yet, the users
blame Atari for the stupidity of these "programmers."

| I'm not going to say that languages like 'C' don't have their place,
|but on the ST they can't come close to assembler for speed, and if you ask me,
|ease of use. Why do these people own STs and not IBM compatibles? If you're so
|interested in portability and standardisation, then you should be looking at a
|different computer...

Well, contrary to what you may think, there are a number of people I know
that would disagree with you. We _ARE_ interested in portability and
standards and we CERTAINLY are interested in following the rules. And we
are NOT interested in looking at other computers. You know, believe it
or not.. real work takes place on Atari machines across the world. And
those people COUNT on working software! Period.

Don't get me wrong.. I like the demos. I download them, I enjoy them. I
look forward to seeing them. But, if you believe that the experience
you gain from writing these demos is going to translate into anything
other than writing code that pushes the hardware to its limits using
illegal methods, then you are kidding yourself.

I appreciate fast quality code as much as the next guy.. but more
importantly, I want code that works. And believe it or not.. It's not
an either/or situation. It is possible to write code that is fast, legal,
and compatible across TOS versions (and hardware revisions).

[..extremely long signature deleted..]

Greetings,
I'm buying the Atari STe and I have few questions about it:

1. I have read in Z*NET that you can put TOS 2.06 in the STe.
Does anyone know where can I get it and how much is it??

2. Does STe have the clock built in?

3. Can I use SC1224 monitor with it, or do I have to buy SC1435?

Thanks

Message-ID: <1992Feb27.093056.8207@rice.edu>
Source record: 225290

I am interested in getting a multisync monitor to replace the T.V./monochrome monitor setup that I have now and would like some advice on the monitors suitable for the ST.

There are also several manufacturers that sell switch boxes for these monitors. Would anyone recommend one over the other?

I am very picky about sharpness in monochrome but if there is a monitor out there that looks very good in medium, I could live with that.

Please email any responses. Thank you.

Message-ID: <1992Feb27.094303.8520@rice.edu>
Source record: 225291

For Sale:

Practical Solutions VideoKey adaptor.

This device converts RGB signals to NTSC composite video and RF. It also has audio out ports and monitor pass-through.

Low resolution is excellent on a color T.V. (better than the built-in RF port on STE's). The colors are clear with hardly any bleeding.

Medium resolution can also be used for occasional use.

$75 or best offer.

Please reply in email or call (713) 893-2173.

Standy....

I am currently nearing a beta-test version of a new shell called SYNTH, which has over 60 of the commonest UNIX commands *built-in* with the option to override any of them if you so wish....

Its looking good so far. When done I will release it as shareware, first as a test-version, and then later as a 'proper' shareware program with enhanced versions available to registered users. I will probably charge about 4 English Pounds to register.

It should be similar to GULAM, but a hell of a lot friendlier, and a lot more powerful in some areas - online help for a start!

Well here in NZ, most of the C64 users went the Atari way as they came
out far cheaper than the A1000 Amiga, most people here seam to have forgoten
that was the first Amiga, but here at first was very dear, Plus very little
software, note the Atari had all the software in those, but now most
Amiga and Atari shops have closed down, only the PC shops survive here now,
but one little know computer that is doing well in this part of the
world is the Acorn Archemides, and Note, they only have one Shop in
the whole of NZ and its only open on Sunday, most of these machines
are sold to schools and colleges by door knocking sales men...

This ones EASY.

ST Stands for 'Sixteen Thirty-two'
This is because the 68000 is a 16-bit processor, but uses 32 bit
internal registers. The address bus is actually 32 bits wide, BUT the 68000
only uses 24 of them, hence the 4mbyte limit :-(

Message-ID: <1992Feb27.124533.13278@unix.brighton.ac.uk>
Source record: 225201

I had a simerlar prob - I kept getting either tos error -35 or bombs.

I traced it back to the version/command of kermit I used to download the software from (No ftp access - booo-hoo) and kermit seemed to change the lenghts of the files, in fact the version of kermit was letting binaries through in text mode without errors !!!!

After trying various commands eg.
Host kermit: set file type binary
Host kermit: server
<server shutdown message>
<press ctrl-]-c to close connection>
local kermit: get <filespec>

This seemed to ALLWAYS work, never corrupting binaries, even through the local version of kermit had no 'set file type' command.

In short - CHECK the LENGTH and if possible the data is not changed during downloading/transfer.

[about the meaning of TOS]
>Popular belief is that it simply stands for
>
>The Operating System

Yes it is, but in the first ST-manuals (the one from 1985) it says TOS is
for Tramiel Operating System. A few years later (1987) when Atari released
the pre-blitter TOS, the manuals was changed (and much improved, but still
not very good). It said TOS is for The Operating System. To be honest, I
don't think that was the original meaning, but since Atari wrote it, I
suppouse they may change the name as they like...
BTW have you ever searched the ROM for the word "love"? Try it out, there
is some info you won't get about Dave Staugas else... (try case insensitive).

So true, but again this has been subject to change by Atari. At the time when
mr Tramiel got the boot from Commodore and bought Atari Corp. There was a lot
of rumors about the Jack'intosh (which when it finaly made it to the shelves
was called ST). The ST was then said to stand for Sam Tramiel (one of Jack's
childs I think). Again the attitude of Atari Corp. have changed since then.

>if they didn't.

In fact Enchanted Lands, the example given above, uses shifter-bug scrolling (of some kind). Hence it doesn't work on ST's with early versions of the shifter chip. (It does, however, work on STe's -- I just checked.)

The reason you won't see scrolling that smooth in other applications is that most programmers want their games to run on all the machines in the market they're supporting; hence they can't use the Enchanted Lands scrolling technique. (Which, I'll be the first to admit, DOES produce really nice results.)

And there are plenty of great games written by excellent programmers who don't resort to cheesey undocumented practices to get their work done. Speedball II, Gods, and Pockets are good examples by the Bitmap Brothers (although their disk access routines take some chances).

One aspect of good programming is doing as much as you can within the limitations of your machine. With demos you can just "change the limitations," because you don't care if your code works on all machines. This is fine for demos, but not for games. And as John mentioned, that's why some people don't like the kind of coding that demos encourage.

Date: 1992-02-27 17:20:33 UTC
From: csw93@seq1.keele.ac.uk
Message-ID: <2190@keele.keele.ac.uk>
Source record: 225208

Does anyone have any information on all the hidden little
features for Crackart? I missed most of the posts to this newsgroup
earlier, and I'd appreciate it if someone could mail me a summary.

Adam

If anyone has these could they please upload them to atari.archive
or UUENCODE them and mail them to me?

Thanks

Bob

reply to 'erkamp@arc.ab.ca'

From Z*Net 92-06.

ATARIHD5.LZH ATHDX5.LZH are both the new Atari Hard Drive
Utilities.(v5. 12/3/91) Inc'd are: HDX v5.00 Hard Disk formatter/
partitioner; AHDI/SHDRIVER v5.00 - Hard Disk Booter. Specially
conf'd ver. of SHDRIVER.SYS, allows non-contiguous device numbers
& enhanced handling of removable media. Please use HINSTALL to
install the new driver; THEN you may copy the SHDRIVER.SYS file.
Read DOCS first!

FUJIM141.LZH Here it is the new release that everyone is
scrambling for... FujiMaus with a new PARK feature! Park the
mouse at one of 9 designated parking spots on the screen after the
first timeout. Unparks back to right where it came from upon any
activity (valet parking service!). Thanks to the folks who sent
in ShareWare! TT Compatible in all resolutions

|> Has anyone ever had a similar problem and if so...WHAT DID YOU DO?

[...]

Last year in august we had a small talk with the author of FCOPY3 (Martin
Backschat, he was introducing his new FCOPYPRO at a fair here in G.).
We asked him about exactly the same problem you have (and also some other).
Especially we had trouble while restoring the backup of drive d: to drive c:,
that was impossible.
'Yes, I know these problems.' was all he said (and 'Buy my FCOPYPRO').
So I think your problem isn't based on your doing, it's the program itself.

You should save what you can save and then use another backup software.
This is the only hint I can give. ap.

2012. Re: *Full* colour ANSI (inc Graphics) Comms Program???

shore@equinox.gen.nz (Craig Shore) writes:
: Has anyone ever heard of a Full colour ANSI comms program for the ST?
: (with the ANSI character set)
:
: I've only seen, at the best, 4 colour ones.
:
: Why? Probably because you need 80 columns with 16 colours, the ST only
: gives you 4 colours in 80 column mode :-(
:
: So is there one available? If so, i'd love a copy.
:
: If there isn't, how about some of you Demo crews writing one for me! :-)
:
: Craig.

Well, as far as I know there is a demo-crew in Sweden (Sync)
working on a FULL ANSI terminal program that is supposed to
be better than Flash 2 and programs like that. However I don't
know if it will give you true 16 colours (I doubt it, probably
rastered gfx instead). If I get any info on it I'll let you
all know!

>only uses 24 of them, hence the 4mbyte limit :-(
>
Well, the thing about it is, a 24 bit address bus (which is what the MC68000 has) allows 2^24 different states, or __16MB__ of addressable memory!!!! That is what I've tried to find out ... why is there a 4MB limit to an ST's memory?? It is definitely _NOT_ the processor's fault. I'm currently taking a class on MC68000 architecture and assembly language, and the 68000 can access up to 16 Megs!! Why can't the ST use it??!!

Hypothetical situation ... what if I had an STe (that uses SIMMs for its RAM). If I had the bucks, why couldn't I use 4MB SIMMS rather than 256KB or 1MB SIMMS?? If I stuck in 4 4MB SIMMS, that would be 16MB of RAM, within the designed capabilities of the 68000 CPU!

So the $68000 question is ... why can't the ST use it? Is it power? Physical size? Some design flaw? I WANT TO KNOW!!!

2014. Re: 'Demo crews'

Newsgroup: comp.sys.atari.st
Date: 1992-02-27 19:49:51 UTC
From: u1398@JSP.UMontreal.CA
Message-ID: <1992Feb27.194951.28735@jsp.umontreal.ca>
Source record: 225210

In article <1992Feb26.122902.15616@tdb.uu.se> m91der@tdb.uu.se (Daniel Eriksson) writes:
[Lots of stuff deleted]
>Well, I must (unfortunately) tell you that many of the new crews
>that are formed today only has one thing in mind, and that is to
>pump themselves up. I'm not saying it's the same for all new demo-
>crews, but if a new demo-crew want to become famous they really need
>to be masters at dirty tricks or have something original to show
>up. And since most things already has been done it's hard to come
>up with something original.

A good demo is not _only_ getting to remove all the borders, to draw 8000
moving pixels per screen refresh to simulate space travel, or to be able
to draw a 140 sided 3D object that can rotate in real-time while playing
a 16Mhz .MOD music file all this while pre-calculating the next demo-screen,
is it?

In the Punish Your Machine demo, there was one incredibly impressive screen,
and that was the one that took a mere few seconds to draw some impressive
Fractals. You say that "its hard to come up with something original". Well,
this Fractal screen was the BEST part of the demo, IMHO. All this scrolling
stuff has now gotten boring. (though by no means not apreciated). Saying
that everything has already been done, THAT's being narrow minded.

Why not use your knowledge of the 68000 to try and write a slightly better
version of that Fractal thing, that allows users to input some data and
watch it create NEW screens, not just pre-entered ones. Or a demo screen
showing how fast you can ray-trace images on the ST? You want to make a
demo that will make "the Delta Force" be the greatest, then apply your
skills to something like ray-tracing (which I assume you probably know
the basic principles of, or can learn them easily). The other "lamers"
who only know about "removing borders" and displaying 512 colors will
surely realise that "they" really are'nt that great at programming.
So they know a few quirks and tricks about the 68000 and the ST? Big deal.

And I suggest to ignore those people who advocate portability of demos to
their newer TT's and Mega STE's -- You specifically make your demo to run
only on ST's. Nobody pays you anything, you give no guarantees. You
never claim it works on anything but an ST. Why give it incredible
limitations so that it will also work on the Mega STE and TT when
the whole purpose is to look at what the _ST_'s could do if the limitations
of the operating system were bypassed. Some people just do not understand
that you are NOT writing a usefull utility that may still be needed when
upgrading to other hardware. Just make sure it works on ALL ST's, thats as
good as it needs to be.

--

And now to take this chance to tell you, of the Delta Force, how I enjoyed demo's on the ST ever since I first saw the LCD demo by TEX 5 years or so ago. I am 20 years old myself, though I am more of a higher-level language person, rather than 68000 assembly coder, I always envied you guy's n' gals for the stuff you manage to produce. If I had more time (from school), I would love to have fun with all sorts of programming projects, including having fun with people like you across the globe, writing demo's. Where do you find the time? Live long, and code well.

>! Neil Forsyth JANET: neil@uk.ac.hw.cs !

Oh? Perhaps you don't like to order and/or read developer
documentation (of course you are in the UK, and I am aware of the problems
they have getting doc's out...)

I quote from the STE Developer Addendum:

CONTROLLERS

```
FF9200 0000 0000 0000 xxxx
||||
|||- Fire Button 0
||-- Fire Button 1
|--- Fire Button 2
---- Fire Button 3

FF9202 UDLR UDLR UDLR UDLR
|||| |||| |||| ||||
|||| |||| |||| ---- Joy Stick 0
|||| |||| --------- Joy Stick 1
|||| -------------- Joy Stick 2
---------------------- Joy Stick 3
```

Four new joystick ports are added. These ports are controlled directly
by the 68000. The current state may be sampled at any time by reading the
above locations.
Joy Stick 0 and Joy Stick 2 bits are _*read/write*_. If written to,
they will be driven until a read is performed. Similarly, they will not be
driven after a read until a write is performed.

```
FF9210 0000 0000 xxxx xxxx X Paddle 0

FF9212 0000 0000 xxxx xxxx Y Paddle 0

FF9214 0000 0000 xxxx xxxx X Paddle 1

FF9216 0000 0000 xxxx xxxx Y Paddle 1
```

Paddles:
One pair of paddles can be plugged into Joystick Port 0 (Paddle 0). A
second set can be plugged into Joystick Port 1 (Paddle 1). The current

position of each of the four paddles is reported at these locations. The fire buttons are the same as for the respective jostick. The triggers for the paddles are read as bits 1 and 2 of FF9202 (JOY0 L and R).

FF9220 0000 00xx xxxx xxxx (X position)
FF9222 0000 00xx xxxx xxxx (Y position)

Light Gun/Pen
A light gun or pen can be plugged into Joystick Port 0. The current position that the gun or pen is pointing to is reported by these registers. The position is accurate to within (X direction only):
4 pixels in 320x200 Mode
8 pixels in 640x200 Mode
16 pixels in 640x400 Mode

Accurate to 1 pixel in the Y direction in all modes. Accuracies do not account for the quality of the light gun or pen. Note that the X position is given in pixels for 320x200 only. In order to get correct results in 640x200 mode this number needs to be shifted left one bit; in 640x400 mode, shifted left two bits.

Controller Pinout

5 4 3 2 1
10 9 8 7 6
15 14 13 12 11

Joystick Port 0 Joystick Port 1
1 UP 0 UP 2
2 DOWN 0 DOWN 2
3 LEFT 0 LEFT 2
4 RIGHT 0 RIGHT 2
5 PAD 0 Y PAD 1 Y
6 FIRE 0 FIRE 2
7 VCC VCC
8 n/c n/c
9 GND GND
10 FIRE 1 FIRE 3
11 UP 1 UP 3
12 DOWN 1 DOWN 3
13 LEFT 1 LEFT 3
14 RIGHT 1 RIGHT 3
15 PAD 0 X PAD 1 X

APPLICATION NOTES:
[these are my addition, to help you use the above information]

The U/D/L/R/FIRE are all active low, with internal pull-ups to VCC;
The PAD n X/Y are assumed to 1MEG variable resistors to VCC; the formula for the positions is approximately:

POSITION ~= R * (379 *10^-6) [MAXIMUM 255]

The system is a set of One-Shots, whose time constant is 1.1RC, where C = 690pF. The width of the pulses is measured by an 8-bit counter clocked by the 500KHz clock. The value is update 2000 times per second.

The Joystick lines that may be driven can be used to "scan" more inputs into the other 6 lines (2 FIRE's and the other U/D/L/R), or can be used to do some other sort of configuration.

The release date of the TT040, I doubt will be so soon as in April
1992, and even if it's released I don't think, that a fully OK
version will be available until maybe April 1993, but, I'm just
assuming :-)
I don't know, if there has been a price discussion regarding the price
of the forthcoming TT040, but, I would guess, that I will be a BIT
more expensive than the TT030. I sure hope, that the TT030 will be
produced awhile more, so some decent software will be relased to it.

BTW, is there anyone that have a little list, of software specially
written for the TT modes? It sure would be nice to see one !

Hello Netters!

I have a Citizen GSX-140+ Printer for sale. It was purchased at the beginning of the year and has had minimal use. It has all instructions, disks, manuals, boxes, etc., and it is all in brand-new condition. I'm asking $250 for it, and if you pay $250, I'll pay for UPS ground shipping to anywhere in the continental US.

If you're interested, make an offer.

Thanks!
Jim

The basic thread has drifted quite a bit. But it is still interesting
to think about the many questions, ethical and technical about software
construction of hardware dependant applications.

I would say, since the demo's are for free, there are no ethical
questions involved.

In fact, Daniel Eriksson, through his rather "direct" attitude about
demo application design, is trying to win support from a largely academic
community.

I would say, stop trying to convince them. Portability is an extreme issue
in the academic community. Your not going to gain support, period.

However, we do like the art, demo crews employ in the programs themselves.
So keep up the good work all you demo coders...

Furthermore, I would like to say Dan, if you want to make a living at something
like this, your going to have to eventually come around to addressing
the academic issue's we all have been bluntly pointing out.

Now, with that in mind. Here is a piece of advice from someone who insisted
I learn C many moons ago instead of going with the BASIC/Asm combination
I used and held so dear...to that "structured garbage" junk....

"Gregory, if you have to resort to Assembly language, you don't understand
the problem and by the time you do, you could have already finished the job."

Seems to have worked out OK for me. :).

2024. C-LAB ST-ATARI series

Hi Guys,
my name is Shane.

I am looking to buy a music machine for sequencer/notation based s
tuff, such as C-LAB ST-ATARI series (Notator).

I believe this one has capacity for you to compose your own
music and play it using its C-LAB software and with the appropriate Atari.

It is an excellent kits for any music lover, I believed!

What I would like to know is how much does it normally costs (software and
harware separately please) and where to get them.

Thanks in advance.

Shane.

No one in their right mind would want to rewrite a program of say even a
thousand lines for each different machine out there I can't stand to do
do things twice. I would much rather be spending my time doing other things,
like reading comp.sys.atari.st.:

First its not economically viable to do so, and like it or not, people
need food, housing and clothes...not only that, modern languages
make it unessacary to do so.

> The day a trick don't work, a good programmer will find a new that does,
>and users (IMHO) should not bother about how the code is written. If they

This thinking simply isn't ethical at all. I assume you mean commercial
code as you didn't specify otherwise.

When I buy a piece of software, like say PageMaker 4.0 for EGADS 499,
I sure an the hell want my moneis worth, which means an application
which has a performance curve exceptable within the given price range,
and better than anything else the competition has. So yes I don care
how its written. So does my wallet.

I think most Atari system software engineers have this kind of attitude which
is why we have to rely on Eric Smith, Dave Small, to give us software
capabilities that are up to date with the times. These people obviously
care about how thier code is written and expect the user should too.

>don't pay for it they should not even bother about if it works or not.
> Programms written for fun are pieces of art, that can not be fully
>understood by anyone but another programmer.

Well almost, the MMU is more of the problem than anything else.

In actuality, a Plain dough 68000 can access 2 to the power of 24 memory
locations...

NOT 4 megs but 16MEGS...Why Atari chode to do restrict the total addressing
range of the 68000 is beyond me. It certainly wouldn't have saved them
any money prodcution wise.

Thank God my Mega STE doesn't have this annyoing problem.

2027. Tape Backup

Newsgroup: comp.sys.atari.st
Date: 1992-02-27 22:33:11 UTC
From: ac999108@umbc5.umbc.edu
Message-ID: <1992Feb27.223311.13988@umbc3.umbc.edu>
Source record: 225222

Help! I can get Tape Backup drives fairly cheaply.. around$150, but I don't know where to get a program to backup my hard drive. I don't want to buy one and find a program doesn't work with it or something. And I'm tired of using my SyQuest for Backups when I can just use it for normal data storage.

If anyone knows where to get one.. please mail me.. thanks!

That's a great idea. How about making the programmers interface to any such routines simulate X windows stuff. It would provide a great starting point for porting some of the more basic X stuff to the ST. I'm currently planning to do an ST port of xdvi - if such a library existed then virtually the same source code could be used on the Amiga.

I'd be prepared to put some time into the ST side of such a thing, though I wouldn't be able to do anything for about a month or so.

The most reliable way to do it is to format them on the PC. If I'm at home
(no PC), I use dcformat.

I find that tcsh causes a bus error when I try to run it under mgr. I get round this if I want to use mgr by having a script that sets SHELL to point to ksh, calls mgr, then resets SHELL to tcsh.

towns@atari.uucp (John Townsend) writes:

:[stuff deleted]

: Now... let me ask you the ultimate question: Do these games you have
: mentioned work on the STE, MegaSTE, or the TT? I wouldn't be surprised
: if they didn't.

As far as I know they work very well on the STE and MSTE. I doubt
that they work on the TT, but then again, how many do? Even lots
of utilities by professional programmers don't work on the TT.

: See, this is the part of the demo crew thing that I
: object to: These people write these cool demos, then real companies hire
: them to develop games, the demo writers write games that cut corners,
: I buy their games, they don't work on my TT, and I am out $40-50, etc.

Does it say on the package that the game should work on a TT???
To make arcade-games that run at 50 or 25 hz refresh rate you
NEED to cut corners if you want more than one sprite at a time
on the screen.

Please tell me hom many games by (what you would call) professional
programmers work on the TT. I doubt you'll find a lot of
arcade-quality games that'll work on the TT (because the
programmers don't have time to make separate TT-versions).

: I don't mind the demos, but it has been proven time and time again that
: the cutting of corners taken by demo writers has made its way into the
: games that I pay MONEY for. That is extremely bad. Worse yet, the users
: blame Atari for the stupidity of these "programmers."

To blame Atari is REALLY stupid, I agree on that. But we could
also look at it another way. IF the dirty tricks invented by
demo-programmers hadn't made it into todays games you would
probably be able to run most games on your TT. BUT the games
would have been much slower (on the ST and STE) and they would
be even longer away from the arcade-games that you insert coins
into.

: | I'm not going to say that languages like 'C' don't have their place,
: |but on the ST they can't come close to assembler for speed, and if you ask me,
: |ease of use. Why do these people own STs and not IBM compatibles? If you're so
: |interested in portability and standardisation, then you should be looking at a
: |different computer...
:
: Well, contrary to what you may think, there are a number of people I know

: that would disagree with you. We _ARE_ interested in portability and
: standards and we CERTAINLY are interested in following the rules. And we
: are NOT interested in looking at other computers. You know, believe it
: or not.. real work takes place on Atari machines across the world. And
: those people COUNT on working software! Period.

True, but then again most applications runs just fine on the
TT, and I don't think the guys you mean play lots of games
on their TTs, or?

: Don't get me wrong.. I like the demos. I download them, I enjoy them. I
: look forward to seeing them. But, if you believe that the experience
: you gain from writing these demos is going to translate into anything
: other than writing code that pushes the hardware to its limits using
: illegal methods, then you are kidding yourself.

You are wrong (in my opinion at least)! You might only have seen
top of the class demos, but I can assure you that the guys
behind these demos once upon a time knew nothing about 68000.
Many have learned to program 68000 assembly language by
writing demos. Some have taken shortcuts and instead of
learning the 68000 they began to use dirty tricks (invented by
others). The guys that never has learned how to use the 68000
to the fullest and uses dirty tricks insted is a threat
against portable routines.

But many guys also learned the 68000 'inside and out'. These
are the guys that has invented all the dirty tricks, and I
think they have a 'right' to use them since they already know
what can be done with the 68000. It doesn't give them an
excuse to use dirty tricks in applications or games that won't
work on all computers though.

: I appreciate fast quality code as much as the next guy.. but more
: importantly, I want code that works.

Don't we all?

: And believe it or not.. It's not
: an either/or situation. It is possible to write code that is fast, legal,
: and compatible across TOS versions (and hardware revisions).

Almost true! To write code that works on all TOS-versions
shouldn't be a problem (if just Atari didn't 'implement'
new bugs all the time ;-). With the hardware it's a bit
different. Who knew 5 years ago that Atari would release
a 68030-based computer that should be 'compatible' with
the ST(E)? As most people know it's quite a differance
between the 68000 and the 68030 (the stack and caches
being three(!) critical things as far as I know). Todays
games and applications SHOULD work on both the ST(E) and
the TT since everyone knows they are around. But there
could also be a problem for guys that write games or

applications: the lack of good easy-to-get information.
Not everyone can afford buying a TT to test the newly
written game or application. And without the right
documentation we are forced to TEST to see if our
programs work.

>Well, the thing about it is, a 24 bit address bus (which is what the MC68000 <why can't the ST address 16Mb??? >

Since all the original ST hardware designers are either dead or serving life sentences deep in Siberia :-) :-) I'll take a stab at it... My understanding is that the Shifter (video) chip wasn't designed to address more than 4Mb [back in 1985, 4Mb was a REALLY HUGE amount of memory - sorta like IBM making the max limit of the PC 640K, since nobody could *ever* user that much memory!]. this might also be the case with the other custom chips.
Several of the 12-mb hacks that I've heard about (and I've used one of them) do away with this, but put a severe restriction upon what you can do to the extra RAM - no DMA, no video, just code and data. Not too bad if you're running GCC, but I'm sure that a lot of the demos being tossed about would croak :-)
I'm not sure of the specifics, but what I've just described sounds awfully like TT-Ram. It's just that on the TT, they figured that since the custom chips couldn't get at the extra memory anyway, they could go ahead and make CPU accesses to it much faster.

>Hypothetical situation ... what if I had an STe (that uses SIMMs for
>its RAM). If I had the bucks, why couldn't I use 4MB SIMMS rather than
>256KB or 1MB SIMMS?? If I stuck in 4 4MB SIMMS, that would be 16MB of
>RAM, within the designed capabilities of the 68000 CPU!

Because it wouldn't work. But seriously, you would need a new MMU chip, which might be a wee bit tough, since at least my STe has his soldered to the motherboard :-(
>
>So the $68000 question is ... why can't the ST use it? Is it power?
>Physical size? Some design flaw? I WANT TO KNOW!!!
>

Check out the SST accellerator. For under $1000, you can have a 50Mhz '030 system (assuming you can stand the 6-month wait for the SST boards :-(You can fit up to 12 MB on the SST.

2037. ***** Atari 1040STf System for Sale *****

Newsgroup: comp.sys.atari.st
Date: 1992-02-28 01:50:23 UTC
From: tdoom@bgsu.edu
Message-ID: <9468@bgsuvax.bgsu.edu>
Source record: 225227
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

Greetings,

Simply put, I am selling a complete 68000 based computer system. I
have used it throughout my career as a budding computer scientist and have
found it to be more than adequate for simple computing and programming needs.

History: this system is extremely well cared for. I have performed
all system modifications myself.

Equipment:

Motorola 68000 based Atari 1040STf computer/keyboard
4 Megabytes 80ns DRAM (Expanded with a ZRAM 3D from Zubair)
720K 83 track 3 1/2" floppy drive (built in)
Built In MIDI In/Out
Atari STM1 Mouse (2)
Atari SM124 Hi-Res Monochrome Monitor
Atari SC1224 Lo-Med Res Color Monitor
Seagate ST296N 85 Megabyte Hard Drive
D&P Under-Monitor Hard Drive Enclosure
Extra Drive Port
ICD Host Adapter Plus (with clock)
Practical Solutions Monitor Master

2400 baud Modem (generic)
Epson LQ-570 360dpi 24pin Printer (Yup, the new one.)
Casio HT-700 Midi Analog Synthesizer

This stuff is worth quite a bit to me. The hard drive is jammed
with all kinds of software (TeX, Gnu Products, Sozobon C, Word Writer 2,
Uniterm, Opus, Midi Software, Noise Tracker (15megs of modules)), etc.
I have spent countless hours compiling a reasonable collection of software.
All of it goes with the system on request. The system currently looks and
acts very much like a **IX box, running MiNT 0.92 (wonderful, wonderful OS,
the author deserves MANY kudos) and a full set of **IX utilities.

NOTE: I am NOT selling the software. . . It just comes with the system
to save the buyer MANY hours of hard work.

The printer, modem, hard drive, and synthesizer are options (I can
possibly use them with other systems.), but the rest must be sold as a
system.

WHAT IT'S WORTH:

Thanks for wading through my babblings. I'm not foolish enough to think that I can get anywhere near the system's worth, but I think that the following price chart is reasonable. COMPONENTS MARKED WITH AN * ARE SALABLE SEPARATELY.

CPU/MEMORY/KEYBOARD/FLOPPY/MOUSE $600
* EXTRA MOUSE $ 15
SM124 $100
SC1224 $150
MONITOR MASTER $ 15
* ST296N/D&P ENCLOSURE/ICD HOST $550
* 2400 Modem $ 60
* EPSON $360 (1 month old)
* HT-700 (Synth) $150

TOTAL $2000

Well, that's it. . . It's pretty negotiable, but I'm fond of round numbers (like 2000). . . I'm real patient and not in a hurry to sell this system: it's my baby :) !

If this looks steep, tell me. I'm not aware of the current market. These prices reflect what it's worth to me. Thanks for your time.

tdoom@andy.bgsu.edu

2038. Atari ST system for sale (mono, 1 meg, 65 meg hd)

Newsgroup: comp.sys.atari.st
Date: 1992-02-28 02:49:36 UTC
From: gl8f@fermi.clas.Virginia.EDU
Message-ID: <1992Feb28.024936.5982@murdoch.acc.Virginia.EDU>
Source record: 225244

Atari 520ST + HD for sale: $700 + shipping

520ST (+ memory upgrade to 1 megabyte) (TOS 1.0 ROMS)
mono monitor
BSD 65 megabyte harddrive (Seagate 277R)
1 SS floppy (*)
Abacus book on GEM programming
Classic 1985 Atari Development Docs
Empire: Wargame of the Century
... and random stuff.

I bought this machine in 1986 and it's spent 2/3 of its life in my closet; too many Suns at work to enjoy playing around with my toy. The memory upgrade can go to 2.5 megs by just plugging in chips (but it's one of the older cards, so these are simms, these are honest-to-god chips); you can go to 4mb with a small motherboard modification.

(*) The only problem with the system is that my floppy power connector is kaput. The drive itself seems to work fine.

First come first serve; send email or leave a message for me at home (804) 971-5887 or work 924-4914.

Mat, one thing that may not have crossed you mind, though it's
carefully pointed out in the " How to get along on Usenet" file
in news.announce,newusers, is that several people involved in this
discussion are not using English as their native language, and that
the translation could be imparting a different impression than is
actually intended.
Now, similarly, I could make the completely unwarrented assumtion
that you hadn't read any of the new user postings because you felt you
obviously didn't need any advice on how to be a new user. But that
would be putting a cultural bias on the scant evidence I have, wouldn't
it?

>rastered gfx instead). If I get any info on it I'll let you
>all know!

I wondder if you could do a good true 16 colour ansi emulator,
using scan line palette changing and some really fast sorting
routing to juggle the colouras around. And scrolling would be
tricky to make fast, especially to keep up at 19,200 baud.
If a demo crew did get one working, that'd definately put
their name on the map with a lot more people.

>the cutting of corners taken by demo writers has made its way into the
>games that I pay MONEY for. That is extremely bad. Worse yet, the users
>blame Atari for the stupidity of these "programmers."
>
Just one counter to this. I agree with John that it's a pain to lay
out money on a game that doesn't work on some machines (Knightmare and
Railway Tycoon, to name the latest disasters), but from what I heard
of the Railway Tycoon incedent, the company didn't have a four meg
machine to test it on. Now who do you blame. With game companies pushing
the programmers to make the games as smooth and fast as possible, don't
they have a responsibility to make sure they have an example of every
machine the game will be run on?
Look at WordUp 3. The story on the net a few months ago when E Arthor
Brown was clearing them out was that it worked wonderfully if your machine
was like the one it was programmed on. Otherwise it has the reputation
as a disaster. Is this rule breaking or inadequate testing?
I also think blaming Atari is incredebly stupid. I notice that the
lists of games originally published in the English game mags as not
working on an STe have been found to work fine on a 1 meg ST. As long
as Atari tech support gave the game companies lots of notice that the
rom was growing, and free ram would decrease, there's no excuse. From
what we've heard from English developers on the net, this is unlikely.
However, the games mags should have at least tried the games on 1 meg,
it certainly would have at least let people know there was a solution.
And it probably would have spurred simm sales too. ;-)

>developed for the IBM.

Well this probably won't happen. Last I heard Darek had something called
the Gemulator running and also an Atari 8 bit emulator that was much faster
than the original machine. The problem lies with the fact that Atari don't
mind their machines being emulated on other Atari hardware platforms but are
quite rightly not going to sanction emulating on other platform (eg PC's).
They can do this because the operating system for the emulators is stored on
disk and it would be illegal to distribute it. However if Darek were to
make his emulator only work with genuine Atari ROMs then he'd be doing things
the same way as Dave Small with his Spectre and avoid a lot of trouble.

Sure? I didn't think these (or the 130ST) ever got sold commercially.
I'm a bit of an ST spotter and one day I hope to see a PS3000.

<disk prob's deleted for brevity>

I reckon you might have some loose chips. Try opening up the unit and pressing the GLUE and DMA chips securely into their sockets. Most of the chips in the early machines were socketed so they might have worked a bit loose.

: >--
: >
: >---------------\ Paul Danckaert | ac999108@umbc5.umbc.edu
: /-----------\
: -
:
: The basic thread has drifted quite a bit. But it is still interesting
: to think about the many questions, ethical and technical about software
: construction of hardware dependant applications.
:
: I would say, since the demo's are for free, there are no ethical
: questions involved.
:
: In fact, Daniel Eriksson, through his rather "direct" attitude about
: demo application design, is trying to win support from a largely academic
: community.

Well, I don't know if I'm trying to "win support". What I'm
sure about is that I want everyone to know that demo-programming
CAN be good for you. The guys that says demo-programming ONLY
is dirty tricks knows nothing about demos. They are of course
right when they say that the dirty tricks is dangerous, but
only if the programmer don't know what a dirty trick looks like.

: I would say, stop trying to convince them. Portability is an extreme issue
: in the academic community. Your not going to gain support, period.

What I'm trying to get into their heads (and yours?) is that
demos are NOT supposed to be portable. A demo should push
a specific computer to its edge, and it's IMPOSSIBLE to write
such code so it's portable, period.

: However, we do like the art, demo crews employ in the programs themselves.
: So keep up the good work all you demo coders...
:

: Furthermore, I would like to say Dan, if you want to make a living at something
: like this, your going to have to eventually come around to addressing
: the academic issue's we all have been bluntly pointing out.

Well, if I ever make a living on programming it won't be with
68000 assembly language (at least I think so). And don't think
I know nothing about portability just because I have been on
the demo-programmers side in this debate.

Here's a little hint: Look at what my organisation is. Do you
really think we write machine-dependant code there?

: Now, with that in mind. Here is a piece of advice from someone who insisted
: I learn C many moons ago instead of going with the BASIC/Asm combination
: I used and held so dear...to that "structured garbage" junk....
:
: "Gregory, if you have to resort to Assembly language, you don't understand
: the problem and by the time you do, you could have already finished the job."
:
: Seems to have worked out OK for me. :).

Probably quite true. But then again, you can't write everything
in C. Really time-critical and/or space-critical code can only
be produced by using the language the computer understands --
assembly language (ok, I know it doesn't understand the assembly
syntax, but you know what I'm getting at ;-).

What you describe has already been done by Claus Brod (the same one that
wrote your HD driver). His Poolfix is called POOLFIX4 and should be avaible
from the usual FTP sites and PD libraries.

I remember that at the time, the naming caused a bit of a stir (Allan Pratt
didn't like it), but the name stuck.

>I don't have the name, since it wasn't in the README file, but if anybody

The D.E.G.A.S .PIx files look like this:

1 Word 0: lowRes (.pi1)
1: medRes (.pi2)
2: hiRes (.pi2)

16 W ST-BIOS color palette

32000 W ST-screen memory

[the following is only for D.E.G.A.S elite PICs ... len=32066]

4 W left limit of one of the 4 animation-channels [0..15]

4 W right limit of one of the 4 animation-channels [0..15 but >= the one from above]

4 W delay of the animation-channel [0 .. 128 0 == 60 changes per second 120 == 1 change in 2 seconds]

Hope it helps

Ewald

The same way you get 512 out of 16 colours, I'd guess. Except,
if my calculations are right, you'd only have to toggle palettes 3
time a scan line, nowhere near as processor demanding as the 16
switches Spectrum does. Whether this leaves enough time to optimise
the palette choices and service tha serial port at 19200, is beyond
my skills to guess without actuually trying to code the thing. However,
like you, I'm not interested in ansi graphics. If they're like most
of the vt52 stuff I've seen, most do silly things like leave the
cursor the eame colour as the background. So I'm unlikely to get
exited about coding one.

However, I'm thinking of coding a Hermes compatable reader that
threads, and supports kill file and a few other rn/trn features,
Would anyone else find this intereting? I need a project to teach
myself 'c', and this is a natural.

I passed this rumour on to a local dealer. He tried 4 meg simms and
it didb't work, no matter what he tried. Personally, I can't imagine it
slipping out without one press relase, or statement online from Atari.
It would have definately pussed my decicision to upgrade my mega to a
Mega STe. I deciced there wasn't enough significant improvements to
warrent the loss I'd have taken on my mega, but if I knew I could stuff
12 meg in there, I'd buy one tomorrow.

2060. Pure C

Newsgroup: comp.sys.atari.st
Date: 1992-02-28 14:57:59 UTC
From: meulenbr@ce.philips.nl
Message-ID: <1992Feb28.145759.15882@philce.ce.philips.nl>
Source record: 225165

Hi,

I have the following questions on Pure C:
1) is it possible with Pure C to link with identifiers longer than 8
characters?
2) does the compiler add an underscore before external names, so you
can mix the objects with dri compiled objects?
3) What is the gain compared to Turbo C 1.1
(in performance, functionality...)
4) Is Pure C also available on other platforms
(we're defititely interested in a unix version to use as cross compiler)
5) does someone have the address of the manufacturer of Pure C, so I
can inquire about the above items (especially 4), and the pricing
involved.

Thanks,

2062. How safe is Gulam/Okami under MiNT??

Newsgroup: comp.sys.atari.st
Date: 1992-02-28 15:10:06 UTC
From: woocm@essex.ac.uk
Message-ID: <2261@sersun1.essex.ac.uk>
Source record: 225159

Just a quickie, I was wondering how safe Gulam or
Okami shells are under MiNT. Has anybody experienced any
series side-effects or are they pretty tight. Thanks.

C.W.

2063. PC emulators

Newsgroup: comp.sys.atari.st
Date: 1992-02-28 15:14:21 UTC
From: ssammy@cs.strath.ac.uk
Message-ID: <SSAMMY.92Feb28151421@lister-04.cs.strath.ac.uk>
Source record: 225171

Has anyone used any 386 emulators? I caught an ad at the back of a magazine,
and it stated that it could handle VGA graphics (mono only).
Is this true, and does it work as fast as a real PC?

BTW At an atari road show a couple of years ago I was talking to an engineer
who stated that an ST board that would accept VGA cards was in the pipeline.

Anyone any comments?

Paul

2065. less, gnuemacs

Newsgroup: comp.sys.atari.st
Date: 1992-02-28 15:52:30 UTC
From: hofmann@cbnewse.cb.att.com
Message-ID: <1992Feb28.155230.29126@cbnewse.cb.att.com>
Source record: 225248

Is a version of less available for the ST that doesn't depend on the
end-of-line /r character being in the file? My version of less is
broken for files written by gnuemacs. If such a version doesn't exist,
is source code available that I can modify?

Thanks in advance.

I don't know about X in particular, from what I've seen of it it's
worse than GEM (it reraws the whole window every time a program makes a
tiny change to the contents for gods sake), but the idea of easier
porting between GUIs would benefit everybody. Perhaps some big shot
out there could work on a standard set of C calls for GUI APIs

>speed or bombast.)

Sorry, this is another sad example of someone who just doesn't see the light. Don't fool yourself into thinking that the amazing demo you've just looked at was written by an amateur programmer. While most demo coders are quite young, they could code 99% of professional programmers under the table. This is beacause in general they've got an extreemly high IQ, and have been hacking night and day for the last 10 years. As PStefan said just look at the ST music programs, and compare demo coders to professional programmers.

Contrary to your belief, the best demos contain quite a few solid techniques and algorithms. The difference is that having little experience, the demo coder will reinvent the algorithms himself, a testement to real human creativity, which is sadly lacking in most software.

From my experience of hacking on the BBC micro, then moving to hacking on the ST. Hacking is what gives you the edge over other programmers, and for computers like the ST, it has the effect that the demo-coders programs seem to be running on at least a 5 times more powerful machine.

One final point. You say "whenever the hardware or system software changes". I had a good laugh at this. Demo coders are completely oblivious to system software. The only system software that's needed is to switch of the 'system. From then on, (at least for purist demo coders like me), it's raw hardware - much more fun.

Source record: 225250

In article <1992Feb27.230311.17248@tdb.uu.se> m91der@tdb.uu.se (Daniel Eriksson) writes:
>As far as I know they work very well on the STE and MSTE. I doubt
>that they work on the TT, but then again, how many do? Even lots
>of utilities by professional programmers don't work on the TT.

Lots of applications programmers write crap code too, though.

>Does it say on the package that the game should work on a TT???

No, but it does say it will work on all ST's, which it (by it, I assume
you were refering to the Care Bears' game) doesn't.

>To make arcade-games that run at 50 or 25 hz refresh rate you
>NEED to cut corners if you want more than one sprite at a time
>on the screen.

This seems like such a cop-out. On the one hand demo crews brag
endlessly about what great coders they are, and on the other hand they
whine about how paltry the ST's hardware capabilities are. There are
plenty of decently written games that have more than one sprite on the
screen in a 50hz frame. You CAN scroll a region in under a frame in
software, although the code is not simple. For another thing, why
MUST you all change the scan rate to 50Hz in the US? Arrgh! That
blows my ST away. (See below.)

Again, look at Bitmap Brothers' games, or the Bullfrog stuff like
Populous or Powermonger. These folks' games work on all ST's and
they're very fast. No cop-outs, no excuses. Just darn good code.

> IF the dirty tricks invented by
>demo-programmers hadn't made it into todays games you would
>probably be able to run most games on your TT. BUT the games
>would have been much slower (on the ST and STE) and they would
>be even longer away from the arcade-games that you insert coins
>into.

This is a vast, unsubstantiated overstatement.

>You are wrong (in my opinion at least)! You might only have seen
>top of the class demos, but I can assure you that the guys
>behind these demos once upon a time knew nothing about 68000.

While it's certainly true that knowing how to program in assembly
language(s) is a definite assest, it's the dirty tricks that demos
promote that we object to. And it's well known and well-documented
programs in higher level languages like C are easier to debug, maintain
and port, so some people question the wisdom of sticking with pure

assembly. Hence the comments you're geting like "this won't help you get a job" etc. Most companies these days won't hire you if you aren't well-versed in some high-level language. There are always exceptions, like embedded systems, where assembly language is all you need to know, but why limit yourself to those kinds of jobs when you could put your talent towards any type of programming you wanted to?

Look at the recent Atari Games job announcement in misc.jobs.offered. Here's an excerpt:

```
*---------------------------------------------------------------------------*
Required Qualifications:
* Bachelor Degree or better in Computer Science or related field.
* C Language programming experience.
* Individual must be a highly motivated self-starter; able to
make significant contributions in a small team setting.

Desired Additional Qualifications:
* Game design experience.
* Motorola 68K microprocessor family experience.
* REAL-TIME systems programming experience/education.
* Computer Graphics experience/education.
* Artistic abilities (visual arts, music, etc.).
*---------------------------------------------------------------------------*
```

The second requirement is C, and this is video game HQ. Your 68000 experience would help you, as mentioned in the second list, but first and foremost you need to know C. This is for writing games like Assault, Race Drivin', etc. So even historically assembly-only companies are using C now because it so much more economical.

Some of the folks who are attacking demo crews (and, since you're their major proponent here, you) may just be trying to give you advice they've found helped themselves. So take or leave the advice, but don't take the whole issue as a personal affront to you or your demo-coding way of life. I really don't think it's intended that way.

I don't think anyone would want to force you to stop writing demos. Perhaps there are some that think you could put your talent to better use. But hey, do whatever makes you happy -- life is short.

>It doesn't give them an
>excuse to use dirty tricks in applications or games that won't
>work on all computers though.

That's my point exactly. Perhaps we're all in violent agreement here, folks. I think the MAJOR problem with all this is that the demo coders honestly DON'T KNOW that their stuff won't run on all ST's. If they did, they'd probably accomodate the early machines with old shifters and old keyboard chips. They'd figure out some ingenious hack that would make those ST's hardware scroll or lose the borders.

It just so happens that I bought an early ST, crica 1986. A friend of mine has an even earlier one. Our machines don't run most demos, and they don't run a lot of games either. This certainly made us more aware of the subtle incompatiblities that subvert the tricks demo coders use, because we'd see a hideous flickering mess on the screen every other time we'd try a new game or demo.

Whenever I mention this I'm told that I'm either blind, insane, have a "broken ST," have a faulty monitor, or don't know how to adjust the vertical hold properly. It's amazing that people cling to the belief that all Atari ST's are hardware compatible, like their 8-bit counterparts, on the basis of seeing not personally seeing any counterexamples. Like solar eclipses don't exist because you've never seen one!

In any case, I doubt demo coders would write stuff that failed on our machines if they had machines like ours to test them on. But the point is that if Atari (or perhaps the Atari community) doesn't say "OK, that techqnique works," then you'd better not use it in anything you sell to people, because you'll end up with angry customers that return your software and never buy anything with your name on it again. Shifter-bug scrolling and overscan are examples of this.

So while in some sense those of us who complain about the dirty tricks may sound snooty or overly-academic, we're just trying to ensure that everyone in the ST world has a fair chance at all the software. And that a group of talented young programmers doesn't fall by the wayside as technology leaves their tricks and hard-core hacking behind.

>With the hardware it's a bit
>different. Who knew 5 years ago that Atari would release
>a 68030-based computer that should be 'compatible' with
>the ST(E)?

This is the whole point. This is why Atari has always encouraged programmers to play by the rules. If you play by the rules, your stuff will run on all Atari computers. Messing with hardware directly is right out unless Atari documents the particular practices you're using.

It's fine to say, "Hell with that!" and code a demo using whatever weird quirks you can exploit. But you can't do this in things you sell. That includes games.

>But there
>could also be a problem for guys that write games or
>applications: the lack of good easy-to-get information.

Yes. Looking back with 20/20 hindsight we might find that Atari's downfall was caused by their lack of programmer support. Programmers docs should be free and easily obtainable. Atari should have done everything they could have to encourage developers. Now that a lot of the best ST programmers have given up hope and gone to the Mac and PC worlds, Atari can only cry in their beers. Was it worth the $350 per developers kit in the long run? I don't think so.

That's a little narrow-minded isn't it? Although the desktop might be good for those who have just started out in the computing world, it's certainly not good enough for more advanced work. This is perhaps Atari's fault in part, since there are very few utilities that the standard desktop boasts, especially when you consider other replacements, such as Neodesk and Gemini. I'll admit desktops can be useful, but you don't really have the contol that a good shell (such as Gulam) can offer. Personally, I use Gemini when I can because it does both things for me - a good desktop and a fairly decent shell. It's just a pity it takes so long to load from floppy...

I just received a fax from PAM Software (FAX 06131 47 64 02) with an impressive list of ethernet products for all manner of ST, both hardware and software. Unfortunately they are priced out of consideration for me; after all, I bought Atari to begin with because of economy. I don't understand why their DMA-ethernet boards (hardware) are 1500 DM, when SCSI-ethernet boards are available for MACs at around $350 US. I wonder why someone at Atari or someone else capable, doesn't develop software so the MAC devices could be used on STs (with SCSI boards). Does anyone know if the PAM software could be used in this capacity?

Another port of it is on cs.uni-sb.de in /pub/atari/tools/gnuplot3.lzh .
I have compiled in only the drivers for:

unknown Unknown terminal type - not a plotting device
dumb printer or glass dumb terminal
eepic EEPIC -- extended LaTeX picture environment
emtex LATEX picture environment with emTeX specials
epson_lx800 Epson LX-800, Star NL-10, NX-1000, PROPRINTER ...
hpgl HP7475 and (hopefully) lots of others (6 pens)
hpljii HP Laserjet series II, [75 100 150 300]
hpdj HP DeskJet 500, [75 100 150 300]
pcl5_port HP laserjet iii (using HPGL plot vectors), portrait mode
pcl5_land HP laserjet iii (using HPGL plot vectors), landscape mode
latex LaTeX picture environment
nec_cp6m NEC printer CP6, Epson LQ-800 Monochrome
nec_cp6c NEC printer CP6 Color
nec_cp6d NEC printer CP6, Epson LQ-800 Draft monochrome
gem GEM window system

The program is compiled with the GNU-readline library (a sample file for
~/.inptrc to customize this is included) and knows about UNIXMODE.

I have the following printers for sale:

NEC P2200 24-Pin Dot Matrix Printer.....$215

Panasonic KXP-1124 24-Pin Dot Matrix Printer.....$240

Hewlett-Packard DeskJet PLUS 300dpi Inkjet Printer.....$330

ALL Prices include shipping and ARE negotiable. No reasonable offer
refused. Reply VIA E-mail.

Here is a list of items collecting dust in my closet. Everything
works perfectly, but I have no use for them.

Atari SC1224 Color Monitor.....$225
Avatex 1200 Baud Modem.....$ 45
Acoustic Research Powered Partners (amplified stereo speakers).$225 pr.
Casio CZ-101 Digital Synthesizer (includes s/w & cables).....$175
Sony D-15 Portable CD Player (great for digitizing).....$135
NEC 720K DS/DD 3.5" Bare Drives (2).....$ 55 ea.
150 Watt Switching Power Supply (XT Type) (2).....$ 55 ea.

ALL Prices include shipping and ARE negotiable. No reasonable offer
refused. Package deals can be worked out. Reply VIA E-mail.

```
As everyone's talking about demos...
Are there any demos for monochrome monitors, including colour demos
which still look good using a colour emulator?
The only one I ever tried was the Snowman demo, but the pictures
didn't look very nice using a colour emulator.

Just curious,
Wolfgang

The COMMAND.TOS that comes with MERCURY seems quite good. It handels
an AUTOEXEC.BAT file as well if you have it auto running on bootup.

hehehe! Maybe it is true, however! You can pick up just about ANY PC
applications-oriented magazine in the US and you will see some clown
selling simple dBase applications for $500! I often see the term
dBase-Guru! The US is filled with people who make a wealthy living
by selling 'applications' software such as this and who most likely
have extremely little programming talent...

>>This is beacause in general they've got

He didn't say anything about demo coders being the only smart, motivated,
and creative programmers in the world.. Just maybe the most obvious of
being so. d:^)

>The crux of the argument is: do you write "good" code, and by whose
>standards? You guys claim you're the best programmers in the world.

>non-believers in your title pages and be done with it...

I don't think anyone can claim to be the best programmers in the world...
Delta Force is certainly one of the most impressive groups on the ST
although I haven't seen much yet of their work. However, Delta Forces
'update' on NeoChrome was an outstanding piece of work. If I were Atari,
I would have hired them to update ALL my software!

I think 'Crikey' is the freshest demo on the ST in a long time and I
would imagine that this will be the direction that ST demos will take.
No fullscreens without reason.. No obnoxious, out-of-place music.
It all fits together well enough that it would be the first demo I
would show to someone who has never seen a demo before.
More impressive than 95% of the Amiga demos in my now 170 disk
collection.
>>As PStefan said just look at the ST music programs, and
>>compare demo coders to professional programmers.

>OK, continuing with Paul's line of reasoning, let's just take a look at
>music software for the ST: Hybrid Arts, Dr. T, C-Lab, etc. all produce
>excellent music software for the ST. Their stuff runs on all ST's (and

>run the "professional programmer's" programs from your hard drive --
>what a concept! If I download another tracker that only runs from
>drive A and has a brain-damaged file selector I'm gonna get violent!

IRRELEVANT! Why are you mentioning MIDI software?! I was talking
about software that runs without the use of expensive MIDI equipment.
So what? Even an Atari and Commodore 64 had reasonably good
Hybrid Arts/Dr.T software! Ok, if you want to talk about MIDI
applications, why not include Virtuoso or Cubase? I think Virtuoso
is quite a low-level 'hack' [or from what I've heard] yet is said to
have a very snappy user interface. Cubase is the nicest I've been
able to play with.. As far as I'm concerned, Dr. T's software could
have been written completely in GFA Basic!

>>Contrary to your belief, the best demos contain quite a few solid
>>techniques and algorithms.

>Care to elaborate on this? What, in particular, are the solid
>techniques and algorithms that you find to be good examples?

Demo coders have become more knowledgeable about slight machine
differences... or so it seems.. Particularly with the STe gaining
popularity. Just look at the Lost Boys latest demo, Crikey! I still
don't believe you haven't been able to get that demo to run.. but that's
my belief... [fyi, I have recently tried the PYM and Crikey demos on an
STe.. They work!]

>>The difference is that having little
>>experience, the demo coder will reinvent the algorithms himself, a
>>testement to real human creativity, which is sadly lacking in most
>>software.

>You're playing the "I can't bring myself up so I'll bring everyone else
>down" game. It's getting tiring. Besides that, you ADMIT that demo
>coders have little experience, yet you still claim that they're the
>best programmers. Sorry, but there are very few people who can claim
>to be the best without years of experience. And as you hinted at in
>your "years of hacking" comments, experience wins out over raw
>brainpower.

They may have had less years of experience but those years are much more
concentrated than your average programmer! how many programmers do you
know are under constant pressure from competition to improve their coding
technique day and night and day and night!??! We don't have any of that
here in California.. Us guys in TPPI are damn lonely!

>And since you didn't actually describe any of the algorithms in
>question it's hard to know whether or not we should be impressed that
>the naive demo coders re-invented them. Yeah, I reinvented "insertion
>sort" and "draw raster on screen" when I was 12 too. That's a far cry
>from designing a complex algorithm or data structure, much less proving
>that it works; e.g., balanced binary trees, Dijkstra's shortest path
>algorithm, efficient matrix multiplication, etc.

Demo's aren't that simple. Particularly the latest ones I've seen.
You can't say that the real-time 3D fractal landscape in Crikey is
a simple algorithm! Nor are fast 3D vector transform routines...
The latest Amiga demos I have seen have become quite sophisticated.
Some take the vector idea further by introducing curved edges, psuedo-
phong shading, etc.. There are now a couple of demos which rotate
cubes [or other objects] with real-time textures.. The daddy of them
all, Cube-O-Matic, would have a cube rotating with a real-time fractal
being generated on one side, a scroller on another side, and static
images on other sides...

Demo coding has absolutely nothing to do with feeding information into
a computer, letting it sit for a couple of hours, and then spitting it
back out! It's a different area entirely but don't think that the
demo world is still scrollers and raster interrupts... It's grown
far beyond that! And I know [contrary to what was said before] that
there is still alot that can be done on the ST... I just think that
most ST demo coders pretty much haven't broken away from the same
megademo formula.. Already, the Amiga demos have opted for visual
impact more than technical achievement.. Look at Hardwire, Voyage,
and especially Odyssey. The latter being a 5 disk, 40 minute long
3D movie that has recently updated to version 1.1c and now
---HARD DRIVE INSTALLABLE---

>>From my experience of hacking on the BBC micro, then moving to hacking
>>on the ST. Hacking is what gives you the edge over other programmers,
>>and for computers like the ST, it has the effect that the demo-coders
>>programs seem to be running on at least a 5 times more powerful
>>machine.

>Five times more powerful? So if I run your code on my 8Mhz ST I should
>expect it to perform like a "professional programmer's" code does on
>Dave Small's SST board running at 40Mhz? Let's get out the benchmarks.

NOT! More like a a 68020 at 16MHz... Or even just an ST with a fast
blitter chip.

>I bet you most programmers started out "hacking." You think you're
>alone in that, but I'm sure you can find hundreds of people in this
>newsgroup with "48-hour hack-a-thon" or similar kinds of stories. They
>may have been working with punched cards or with all-text displays, but
>hacking is hacking. That's why some of the dreaded professional
>programmers will see your fixation with obscure tricks as nothing more
>than a phase they've been through themselves.

Sure! There are lots of great stories of legendary hackers.. Read up
in Steve Levy's book, 'Hackers' and you will find great stories of the
original MIT hackers.. Such things as writing software to play music
by vibrating a low-level driven printer head... More closer to the subject
is about a guy named John Harris who coded games on the Atari 8-bit in
the Early 80's. He eventually got with Atari over coding a perfect
version of Pac Man and gave it away free.. I wonder where he is these days..
I wonder if it is the same John Harris that wrote unlzh172.. hmm...

2089. Ms dos boot on ST disk

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 00:58:01 UTC
From: chan@pyramid.cs.unr.edu
Message-ID: <2955@equinox.unr.edu>
Source record: 225180

I have a quick question about using DC Format 3.0. It allows an MSDOS executable boot sector so that an MSDOS machine may read (and write it?).

Anyway, the dcfmt30.arc from atari.archive DID NOT come with the help program, so I don't know some things about this option.

Does it matter how I format it (the disk)? 9 or 10 sectors? 80 or 82 tracks? normal or twisted? single or double sided?

How would the MSDOS HD drive read it? Or does it matter? That it only needs that MSDOS executable boot sector... (since the format of ST and IBM are the same)...

Thanks in advance!

>

Does Atari plan to ship STe's in the future with TOS 2.06 or continue shipping with TOS 1.62. When TOS 1.04 was released as an upgrade, it was shipped in the new machines. Seems logical that this would be the case for TOS 2.06.

2091. Adds posted earlier

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 02:24:23 UTC
From: prkeen@nuchat.sccsi.com
Message-ID: <1992Feb29.022423.14406@nuchat.sccsi.com>
Source record: 225188
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale,misc.forsale.computers,tx.wanted,tx.general,tx.forsale,houston.wanted,houston.general,houston.forsale

This last week, I have posted for sale adds for my Atari 8-bit equipment with
my work phone number over several networks and on SEVERAL non-networking
BBSes. The equipment is still for sale, but PLEASE DO NOT call the number
in the add. I wasn't even thinking correctly when I did it until I got
suspended for a day for doing personal business at the work place. 2/28/92 is
the day I got suspended due to that reasoning. If you call me at work, you
will not get in touch with me because my calls are going to be screened if they don't
terminate me first. You can
leave me e-mail on the HACE BBS at 713-458-9923 to user #38 if you have
any questions about my 8-bit equipment. I am so sorry for the inconveniences.
It was just a matter of several little mistakes of 1) Not paying attention to
the work rules, 2) Not thinking first before posting my work phone number,
and 3) doing things I'm not suppose to do. Well, hope you understand.
Phillip Keen
PS: For those who didn't see the add, here it is again but without the work phone number:
FOR SALE:
========

Atari 130XE Computer $ 65
30 mb. hd. system with MIO $240
NEC Color Monitor $ 40
Atari XMM801 Printer $ 60
Atari 1050 Disk Drive $ 65

All cables are included. The MIO
has 256K and the SCSI/SASI hard
drive port has been repaired. The
XMM801 printer was freight damaged
All that was damaged was the cover.
The paper knob was damaged by me
turning the paper backwords. Both
of these can both be replaced. The
30 megabyte hard drive system is
two seagate hard drives. A 10 meg.
and a 20 meg. The system boots off
the 20 megabyte one. Due to the
repaired SCSI/SASI port, I would
prefer not to have to split up the
MIO and the hard drive, but will
consider it as a last resort.
The hard drive system includes
a working Carina II v2.5 BBS
system and quite a few other misc.

files. Out-of-town orders the buyer
must pay shipping.
Phillip Keen

2093. Free TeX for Amiga & Atari, Volunteer Needed

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 03:42:14 UTC
From: jon@radel.com
Message-ID: <1992Feb29.034214.15009@sed.stel.com>
Source record: 225102
Cross-posted to: comp.sys.amiga.misc,comp.sys.atari.st,comp.text.tex

I have for some time now been involved with distribution
of TeX on floppies for PC clones and Macintoshs. This
is now being handled by the TeX Users Group as a service
to TeX users who do not have good access to the online
archives of such material.

The only reason that the software is currently limited
to those two computer types is that those are the only
ones that I have particular experience with, or access
to. This is, of course, rather silly, as there are
nice, free versions of TeX for other microcomputers
too.

I would be interested in hearing from anyone with
knowledge of TeX on other platforms who could
steer me in the right direction, or who would
even consider volunteering to supply master floppies
with the software on them. All I could give in
return would be your name in rather small lights
(though I could cover the postage, floppies, and
such things).

Thank you.

2094. Atari Profibook ST-STE-MST(E)-TT, English edition

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 04:16:59 UTC
From: ACPS7048@RyeVm.Ryerson.Ca
Message-ID: <92059.231659ACPS7048@RyeVm.Ryerson.Ca>
Source record: 224999

I wouls like to take this opportunity and pass on a few facts regarding
the "ATARI ST BIBLE" which with the help of all ST users around the world
might become possible.
I recently received a message from Mr. Jankowski regarding my enquiry about
an english edition of this excellent book. This book is a MUST for every
serious programmer on the ATARI ST and contains a wealth of information
on the ST,STE,MST(E),and the TT. At 1491 it contains everything you ever
wanted to know about the ATARI computers. Unfortunately this book was
translated into a few languages and english is not one of them.
The authors were not able to convience their publisher to release an
english edition thus I am posting this message and people who are
interested can write directly to the publisher and hopefully the english
edition will become a reality. The more letters will arrive at SYBEX the
more increases the chance for it to be released.
Here is the address to write to:

SYBEX, Inc.
2021 Challenger Dr. #100
Alameda, California
USA

The german edition is published by SYBEX-VERLAG Gmbh (Germany).
Thanks.
P.S.: Many thanks to Mr. Jankowski, Rabich, Reschke for taking the time
and being very helpful.

Care to back anything you say up with facts, or are you just going to continue spouting this silly rhetorical flame-bait? This sounds like "I can drink more beer than you, NYAAH!" Sheesh.

>This is beacause in general they've got
>an extreemly high IQ, and have been hacking night and day for the last
>10 years.

Yeeeah. And no professional programmers (which in this thread seems to mean "people who don't write demos") fit into this category. I really *don't* understand why you think you and your friends are the only people who are smart, motivated, creative, etc. And anyway, nobody said you weren't smart, creative, or motivated, so there's no need to get defensive about it. I think we all know you're smart. We'll all admit you're creative. And you're obviously motivated AND sprited, judging from all the noise you're making here defending yourselves. But all this is irrelevant; you're simply trying to make this a personal argument when it's not one at all.

The crux of the argument is: do you write "good" code, and by whose standards? You guys claim you're the best programmers in the world. Constantly. Better than 99% of professional programmers, was it? By your standards this may be perfectly true, but when you try to convince professional programmers, who have actually written useful applications that run on many machines that you're right, you're fighting a pointless uphill battle. If you're so confident you're the best, why bother arguing it? Just put something nasty about all the non-believers in your title pages and be done with it...

>As PStefan said just look at the ST music programs, and
>compare demo coders to professional programmers.

OK, continuing with Paul's line of reasoning, let's just take a look at music software for the ST: Hybrid Arts, Dr. T, C-Lab, etc. all produce

excellent music software for the ST. Their stuff runs on all ST's (and probably TT's), and is used by *professional musicians* every day. The things you mention, including Music Studio, are TOYS. And GEE, you can run the "professional programmer's" programs from your hard drive -- what a concept! If I download another tracker that only runs from drive A and has a brain-damaged file selector I'm gonna get violent!

>Contrary to your belief, the best demos contain quite a few solid
>techniques and algorithms.

Care to elaborate on this? What, in particular, are the solid techniques and algorithms that you find to be good examples?

>The difference is that having little
>experience, the demo coder will reinvent the algorithms himself, a
>testement to real human creativity, which is sadly lacking in most
>software.

You're playing the "I can't bring myself up so I'll bring everyone else down" game. It's getting tiring. Besides that, you ADMIT that demo coders have little experience, yet you still claim that they're the best programmers. Sorry, but there are very few people who can claim to be the best without years of experience. And as you hinted at in your "years of hacking" comments, experience wins out over raw brainpower.

And since you didn't actually describe any of the algorithms in question it's hard to know whether or not we should be impressed that the naive demo coders re-invented them. Yeah, I reinvented "insertion sort" and "draw raster on screen" when I was 12 too. That's a far cry from designing a complex algorithm or data structure, much less proving that it works; e.g., balanced binary trees, Dijkstra's shortest path algorithm, efficient matrix multiplication, etc.

>From my experience of hacking on the BBC micro, then moving to hacking
>on the ST. Hacking is what gives you the edge over other programmers,
>and for computers like the ST, it has the effect that the demo-coders
>programs seem to be running on at least a 5 times more powerful
>machine.

Five times more powerful? So if I run your code on my 8Mhz ST I should expect it to perform like a "professional programmer's" code does on Dave Small's SST board running at 40Mhz? Let's get out the benchmarks.

I bet you most programmers started out "hacking." You think you're alone in that, but I'm sure you can find hundreds of people in this newsgroup with "48-hour hack-a-thon" or similar kinds of stories. They may have been working with punched cards or with all-text displays, but hacking is hacking. That's why some of the dreaded professional programmers will see your fixation with obscure tricks as nothing more than a phase they've been through themselves.

> I don't really see why anybody wants to turn their ST into a green
>screen terminal running a defective UNIX shell but I supose its up to
>you.

look: programmers generally prefer some sort of shell to work under since
it is generally faster to type that point an click. try it sometime on
something more substantiall than a "hello, world" code. gulam was one
of the first decent CLIs that just happens to emulate the unix csh. it is
still pretty good, especially for people with small memory/disk systems.
the alternatives (bash, tcsh, etc) tend to be huge, meaning you have to
be pretty serious about programming and hence have a substantial system.

can we stop this "you are stupid for using anything but {desktop,shell}..."
line? there are valid reasons for using both. just because you are
repulsed by the one you don't use doesn't mean someone else is not
equally repulsed by the other. for the record, i am on the "gulam" side
of the fence (and find anyone using the desktop to be... :-).

let's move on...

2102. 1040 ste -> 2.5 meg help

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 07:04:05 UTC
From: ckchan@engws7.ic.sunysb.edu
Message-ID: <1992Feb29.070405.12995@sbcs.sunysb.edu>
Source record: 225192

I have a quick question for the group. I'm going to upgrade my girlfriends
1040 ste to 2.5 meg, and I need to know which two simms to replace.
Is it the 1st and 3rd or the 2nd and 4th one? w/ you faceing the keyboard.

The manuals did not say anything since the computer came with a manual for the
1040STfm and a 2 page addemdum (sp?), and I am unable to locate an old issue
of a mag with the instructions.

Please send email, as I do not want to waste any more net BW.

Thanks,
Chi K. Chan

Pure C once was Turbo C 2.0, but since Borland gave up the ST-Support the
developers of Turbo C ST (Pure Software) got back their rights on their com-
piler to further develop and sell it (as far as I heard they therefore mustn't
use the name Turbo C and mustn't sell it outside Germany).
The only other platforms are the ones where the old Turbo-C exists... :-(

This is very true. It depends on the game of course, but there are normally
a lot of non critical parts that don't need such careful coding. For example,
I'm coding an ST version of star fleet battles (have been for a while
actually, at a fairly low priority), and the vast majority of the game can be
coded in C. So far the only stuff I've gone to assembler for has been the
graphics (incidentally, the only assumptions I make are that any screen I
output to will have an arbitrary number (1 or more) interleaved bit planes).
Trying to write the vast amount of admin stuff in this game would have been
a serious nightmare in machine code

>Some of the folks who are attacking demo crews (and, since you're their

If you have access to a Unix machine you can take the source from there. Its
a very easy port, but make sure you set your compiler to default to 32 bit int-
s
(a wise move for any Unix ports). Most of the work I needed to do was to fix
things like integers being used where pointers were intended, etc.

Arggh, burn the heretic!!! 8-)

Seriously though, once your inside a program a GUI user interface can be very helpful. OTOH, the desktop is far too limiting for programming (which is obviously not to say that you can't, but working from a shell gives you conveinent access to a host of tools that will make your life a lot easier). Neodesk, Gemini, etc, whilst improvements, are really aimed at the user rather than the programmer. Of course, all of this is merely a personal opinion.

Kev

|floppies as if they were formatted by TOS, no matter what version you have.

Mine cannot, and I have 2 standard single-sided(!), double-density floppy
drives (SF354). It just bit me the other day, that everyone thinks you
have a double-sided drive. Mine only handles 360K.

Sorry, I replaced my old single-sided drive last year. I was fed up with
not being able to run the new games which came on DS disks. I really think you
should upgrade if you can possibly afford it.

2117. Current State of Atari Archive (and the others for that matter)

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 16:29:17 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Feb29.162917.721@terminator.cc.umich.edu>
Source record: 224976

Well folks,

It would appear that the archives will continue on, at least in a reduced service form. By this I mean that Fred Swartz, our archive administrator, was RIF'd (fired). The archives themselves will continue on, by volunteer power (as a.a always has been).

Where they will wind up is the current question. There has been talk of locating them on machines in various departments throughout the U, but I'd go so far as to say that a.a will stay put, at least for a while longer. The others will undoubtly move soon.

Many of you have asked (and even hypothesized) about exactly what it going on here; why were the archives in danger in the first place. From my point of view, which is very limited, it appeared to be at first a budget cut. However, as more discussion took place, and more lies and half-truths were told, it appears that there's some higher agenda ofr ITD management. What is it? Beats me.

I'd like to thank those of you that sent mail in to the archive.support address. There was some particularly compelling testimonials there, and I think your outcry, combined with the continued "what the hell?" from the archivists here, made the difference. It's a bummer we lost Fred, but ....

Any further comments, concerns, or clarifications to the address above (or below)

weiner

I'd like to ask a serious question; *WHY* is Gulam the CLI that everyone
likes so much. I can see the use of a CLI when working with programming
environments, but there are better shells than Gulam. How about Okami,
or the shell that comes with Gemini, or Bash? Bash is really large,
though, so that might be a disadvantage unless you have a real need of
something Bash offers. Okami is compact, and reliable. My experience
with Gulam was horrible, to say the least. The built-in Emacs crashed
(two bombs) two out of every three times I tried to use it. Aside from
that, the shell itself seemed to work moderately well. Nowhere near as
smoothly as Okami, though. The main problem with Okami is that it
doesn't offer the alias option, but uses functions instead. Mupfel does
offer aliasing, though, and just about all the other features you really
need. A CLI is great for programming, but not really useful for
every-day use.

This is very true. It depends on the game of course, but there are normally a lot of non critical parts that don't need such careful coding. For example, I'm coding an ST version of star fleet battles (have been for a while actually, at a fairly low priority), and the vast majority of the game can be coded in C. So far the only stuff I've gone to assembler for has been the graphics (incidentally, the only assumptions I make are that any screen I output to will have an arbitrary number (1 or more) interleaved bit planes). Trying to write the vast amount of admin stuff in this game would have been a serious nightmare in machine code

If you have access to a Unix machine you can take the source from there. Its
a very easy port, but make sure you set your compiler to default to 32 bit int-
s
(a wise move for any Unix ports). Most of the work I needed to do was to fix
things like integers being used where pointers were intended, etc.

Well ... first hand information:

We (german Atari-Dealer) got 1 (one) ST-Book last week.

It came with only 1M of Memory and there's no manual included, but it works.

Other stuff enclosed is:
- Power supply
- NiCd battery
- Pack to hold 7 alkaline batteries
- Data transfer cable (Centronics <-> Centronics)
- Harddisk adaptor cable (Book <-> ACSI)
- Midi adaptor cable (Book <-> regular sized connectors)
- some sheets of paper telling how to install software

Hopefully there are more to follow :-)

Cheers, Paddy

P.S. I haven't heard of a TT040/Falcon yet, but then ... there's the CeBit
fair on 11.-18. March :-)

2124. Atari STe/TT Profibuch (was Re: Technical Books)

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 19:43:36 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Feb29.194336.18849@news.Hawaii.Edu>
Source record: 225106

Anyone wanting THE book for the STe/TT computers should order the
"Atari Profibuch" masterpiece by Julian Reschke! I didn't receive
my copy yet, but here's a description from the Sybex catalog:

"Ein MuB fur jeden Atari-ST Anwender," meinte die
ST-Computer zur Erstausgabe. Die uberarbeite und
erweiterte Neuausgabe bringt viele neue Infos auch
zum STe und TT: von der Hardware uber Erweiterungen
und die Programmierumgebung bis zu den Betriebssys-
temen (TOS 1.4, 1.6 STe, 3.0 TT), den neuen Grafikmodi
u.v.m.

1504 Seiten, Best.-Nr. 3888
ISBN 3-88745-888-5
DM 79,-/oS 616,-

With over 1500 pages, it probably covers every technical aspect of the
STe/TT series (and maybe includes an entire encyclopedia too :-)).
I hope that someone will review it for some of the ST magazines and
let other people know about it. Diane King at Sybex U.S. said that
they are open to suggestions, so if everyone gives her a call/fax,
they'll be persuaded to publish a version in English. People in
other countries can contact their nearest Sybex distributor and tell
them to fax their requests to Sybex U.S.

MiNT is a really good replacement for TOS. It allows any .TOS file to run in the background (.TTP as well, of course) and offers nice things like pipes, job control, alternate file systems, and other extensions to the system. It is quite compatible, but has trouble with some GEM programs that cheat on window scrolling. I'm not sure why. MiNT is not very hard on memory (150K I think) and it works fine with just about any shell. Better from a shell, in fact. There are some utilities that you can put in your BIN folder that allow you to start tasks in the background and control what is going on. I can't tell you much more about it except that it is really a great program. The author of MiNT is Eric R. Smith. (Someone who knows more about MiNT will probably add on to what I've said, if this is not enough or not correct.)

File name completion. Built-in tools like grep. File name completion. Aliases. Did I mention file name completion?

I've got a simple gulam alias so I can type "k" to make. You can't get any simpler than "vi, fix bug, k, run program, vi, fix bug, k, ..." without using an interpreted language. I'm not interested in touching my mouse when I program since it's slower than typing "k." 1/2 :)

> A CLI is great for programming, but not really useful for
>every-day use.

Programming IS my every-day use. Gulam has many problems but I have yet to see a more comfortable alternative. (Though the new shell that was recently mentioned here sounds very good. I've been meaning to try it out.)

2127. Current Notes magazine info

Newsgroup: comp.sys.atari.st
Date: 1992-02-29 21:28:03 UTC
From: boyd@pi.cs.fsu.edu
Message-ID: <1992Feb29.162803.16785@mailer.cc.fsu.edu>
Source record: 225020

Here is an old response I wrote to a query about Current Notes magazine. I recently mentioned it again, and have been flooded with email requests for the information. Thus, I repost this . . .

----------begin included text---------

In article <1550005@hpcc01.corp.hp.com>, freds@hpcc01.corp.hp.com (Fred Saavedra) writes:
>What is the Current Notes and where is it available?
>
>Thx

Heehee, funny you should ask. Current Notes is a magazine for Atari computers. I would estimate that 80% of the coverage is for the ST/TT line, with a little bit of 8-bit stuff thrown in. It started out as a users group newsletter, and has grown into a fairly hefty mag. The magazines end up being mostly software reviews (real reviews, not based on advertising dollars), with some articles (Dave Small writes for this mag, by the way) thrown in for good measure. I really like J. Andrejz Wrotniak's articles (he is VERY critical in his reviews and recommendations, and has saved me big $$$$ in the past). They also have the best PD library for the ST that I have had experience with. They take the time to make sure everything works on the disks (and that they have no viruses), and they will update versions of stuff if you mail the disk back. Another thing I really like about the mag is that they print an index of articles every year, so you can look stuff up easily. I liked the mag (and the availability of the index) so much I bought all the back issues. I refer to my "CN library" quite often to dig up answers to questions posted to this group. Every issue has a bunch of ads from mail order outfits (something harder to find nowadays).

There are two things that have made my ownership of an ST something other than an expensive mistake. One is comp.sys.atari.st, the other is Current Notes. Without these two resources, I would have gotten rid of my ST years ago. I have given away subscriptions to several ST owners over the years, and they have all renewed their subscriptions after my gift ran out. It really is a great magazine. There is at least one Atari computer store up in DC that gives away a subscription with each ST they sell, and I understand the renewal rate is very high with these subscriptions also.

(Addendum: Add a third thing to my list: atari.archive.umich.edu, which is in danger of being budget cut out of existance!!! Be sure to email support of this ftp site if you have not already done so.)

I am not connected with CN in any way, other than as a satisfied customer. Their number is (703)450-4761. Subscriptions run at $27.00.

---------end included text-----------

Hope this helps y'all out.

The 4-player adaptor (easy to make, by the way) plugs into the printer
port on ST's, so if you have a printer plugged there (as opposed to an
atari Laser, which uses the dma port) you need to either disconnect the
printer (as above), or you can merely turn the printer on and take it
offline. This should be true for any of the games which use this adaptor
(Projectyle is GREAT with three players!!!).

RTFM! But if you don't have the FM then use logic!

Rules:
There are 8 SCSI addresses, so there will be 3 jumpers for SCSI address.
There will probably be a jumper for parity.
There will probably be a pin pair which lights an LED to indicate:in use.

Assumptions:
There will probably be 5 jumpers, corresponding to the above.

Actions:
Place a jumper on the center (3rd) jumper pair. This pair must be
an address pair if the address pins are adjacent to each other.
Use your software to scan for SCSI devices and see what address the
drive is at.
Now you know which bit of the address that pin controls.
etc...

Znet issue #9207 had the probing interview with the ST Book's principal designer, Tracy Hall, who managed to cram virtually the entire STe hardware into an area the size of _half_ the 520/1040 STe keyboard. The interview is supposed to be a reprint from Atari Explorer (1/92).

ASCII magazine (12/91) covered Comdex in a special section and had the ST Book as the second topic after some discussion of the Apple-IBM joint venture. There is a nice picture of it lying next to a stack of Explorer mags and on a speckled marble table. The ASCII reporter plays up the fact that it allows music composition/playing with its built-in MIDI port, its full-day (10 hour) operating time and light (4.2 lb) weight. By contrast, the Apple PowerBooks lack MIDI (and supposedly, unreliably with it) and turns into a five pound PumpkinBook after only 2-3 hours of operation!

Computer Shopper (1/92) also had an ad by JB Micro Sales (a company that sells portables from IBM, Apple, ATT, etc.) which lists the ST Book, so it looks like Atari will make them widely available.

Atari's ST Book specs:

```
Processor......: CMOS 68000
Clock Frequency: 8Mhz
RAM Memory.....: 4 MB
Screen.........: 640 x 400 (high-contrast LCD)
Hard Disk......: 20/40/80/120 MB
Interface/Ports: 2 x MIDI (mini-DIN)
RS-232
Parallel
ASCI-Floppy
General Peripheral I/O port
128 Pin Bus Connector
Easy access 256 KBx16 ROM

Keyboard.......: 84 (+10 key embedded alt. numpad) STe/TT compatible keys
Built-in Vector Pad

Options........: Internal 2400/9600 baud Fax Modem
External Keyboard
Mouse
1.44MB Floppy Drive (external battery-powered)

Operating Time: .....................up to 10 Hours (2 hour full recharge)
Weight (including ni-cad batteries)....2.1 kg
```

Oh boy you touched on a nasty subject with me..IQ tests.

How incredibly innane IQ scores are. They don't reflect initelligence,
because man doesn't even know the nature of intelligence in the
slightest detail.

This part of your defense is innane. I would bet that if you could
only get a comp sci degree by taking an IQ exam, we would have awefully
smart IQ exam people writing extremely DULL application software.

Intelligence isn't measured by idiotic demo coding. Niether can you
measure hate, or anything else which drives the human brain.

[Advance warning: This post does not flame anyone (intentionally, at least)]

Oh, performance oriented programming for Unix is far from dead. Some of these "structured programming" zealots should take a peek at the SunOS source, which has some of the most gawd-awful hacks I have ever seen (but that kernel has to run FAST). Unix is a "monolithic" system, which basically means that parts of the memory manager and file system are included in the kernel so lots of speed hacking and low level dirty tricks can take place. Modular OS's which completely modularize these functions look great on paper but suffer in performance (and are much easier to maintain, and one hell of a lot easier to understand in undergrad OpSys class :-)). A good example here is Minix, which was designed to be purely educational. There is some serious limit-pushing and speed-hacking in all commercial grade compilers as well. Of course, more attention to hardware portablility is paid to OS and compilation software than in your average ST demo, but the scope of importance (and the $$$$'s involved) is vastly different between such applications.

I find it humorous that some folks seem to feel that the Unix realm is defined by structured programming. Super optimized C code is some of the hackiest in creation. Also, there is a lot of similarity to the "Demo guys vs. the structured programmers" debate here and the "K&R gets things done quick" vs. ANSI's better compile-time error checking capabilities" debate going on in the Unix C programmers realm. The conclusion there seems to be "Hey, it depends on what you are doing and what you are used to". Words of wisdom.

Now, I am not knocking structured programming. By all means, structured programming techniques produce clean modular solutions to problems. Such programs are much easier to maintain and modify than hacky (speedy) code. The best programmers I know write their stuff in a very structured way. It is much easier to get it to work in this form. Then, if the application is very speed critical, they go back and start hacking like crazy (or, they call on the skills of a guru for that particular system/OS). A cycle here, a cycle there, some inline assembly scattered around, and whammo: a fast program. Is it still "structured"? Probably not. Do all applications need this second step? Absolutely not! If execution time is not that big of a deal, it is much better to keep the structured one around (for those inevitable bug fixes and functional extensions)! On the other hand, something which must

run fast simply has to be "hacked" on. Even the best optimizing compilers cannot compete with a bit of human trickery and some low level code in the right places (as a matter of fact, there need be no competition, there should be cooperation here). I would say that more stuff stays in a structured form than not. However, it is almost certain that those structured applications will be running on an OS that is speed optimized, and it is almost certain that they will be compiled with low level optimized (and optimizing) compilers. Apples and oranges . . . . .

As an example, I recently worked on a project that, for easier debugging and more comprehensible compiler messages was first written in ANSI C. After we got the results coming out right, we ran ansi2knr on it (which converts the nice "safe" ANSI code to K&R C), and hacked the hell out of it. Several major functions were replaced with assembly modules. On our last compile, we generated the assembly instead of an executable, and performed some more optimizing by hand. We managed to cut execution time in half. This is some real world programming: some of both worlds being argued about here. On the other hand, it would be foolish to hack up the source to something like a passwd binary, as the execution speed is not really important (within reason), whereas easy modification and absolutely no weird side-effects are extremely important (to keep those Internet crackers at bay). Most of the stuff we ask computers to do ends up waiting for us (or other I/O) most of the time anyway. But for those things that must run as fast as possible, low level optimizing specialists will always get paid big bucks to speed them up (and I would think that demo writing would be great practice for such work).

My point here is, most of you are right. The method for finding a software solution to a problem depends completely on the problem. If the problem is to write a word processor that will work on all IBM PC's in existance, structured (or "mostly structured") code is the way to go. If you need balls-to-the-walls speed, low level hacking is the way to go. If you need reliability AND speed, some of both is required.

If you want to write demos that do things thought impossible on that particular machine, it seems to me that the second route is the only way to fly. The harder the limits are pushed, the less portable (across various ST's and TOS's) you get. I think some of the results are well worth this (I am a major demo fan myself, hats off to you folks), and they could always write several versions to accomodate more ST types (STE, TT's, various versions of TOS, etc). On another note, I would be very pissed if my Tempus II did not work on any ST I might choose to work on (it is actually old enough that this might be true :-( ). In such an application I would demand that it perform no tricks that could not be reliably replicated on any ST. Having a text editor that runs 5 times as fast, but bombs if I go to a friends house to do some programming is of no use to me. Again, it depends on the problem to be solved . . . .

The above is right off the seat of my ass at 2am, and probably has a hole or two in it. It is also IMHO. I am not attempting to flame anyone. On the contrary, my ideas described above tie the two sides of the ongoing debate together (in my mind).

I don't know if it is possible with Timeworks DTP, but I do this with Pagestream all the time (this is why I chose this program). This has allowed me to stave off buying a Laser so far (more money for other goodies).

Just my $0.02.

2138. Initial comments - TOS 2.06

Newsgroup: comp.sys.atari.st
Date: 1992-03-01 08:00:04 UTC
From: atilghma@sdcc13.ucsd.edu
Message-ID: <29754@sdcc12.ucsd.edu>
Source record: 225118

I just finished installing TOS 2.06 in my 520STe, and after
playing with it for a few hours I have a few comments:
It "seems" much faster - not that it's actually faster,
but Atari seems to have hidden its slowness
through (careful?) design... Pretty nice!
MiNT works with it. (yeah!)
STalker doesn't detect alt-keypad ## keypresses, probably
because of the new "feature" to access all 256
chars. Did this really *need* to be in _ROM_?
Is there a fix for it?
The Desktop uses the Atari fileselector even though I've
loaded up an alternate. All other programs use
the alternate, but the Desktop chugs along with
same old thing. Are we seeing Atari make direct
calls to the Fileselect() routine instead of
doing it like everyone else? Hmm....
Turbo ST doesn't work. No surprise here, I guess I'll just
have to switch to Quick ST. Oh well :-)

Anybody else have any comments?

>executable boot sector so that an MSDOS machine may read (and write it?).
>
>Anyway, the dcfmt30.arc from atari.archive DID NOT come with the help
>program, so I don't know some things about this option.

I personally prefer the program ps2form, also at atari.archive. It does
some things that some weird PC's (Japanese model NEC's and PS/2's, hence
the name) require to read/write floppies properly. It is not as fancy, but
it always works when a DOS/ST compatible disk is needed. Also, if you
get Universal Item Selector III (you should) it will put the correct boot
sector on the disks. It also selects a random serial number for the disk
(not all ST formatters do this, even the ones that are supposedly PC
compatible). This is very important, since this is what is used to
detect media change in most PCs.

>
>Does it matter how I format it (the disk)? 9 or 10 sectors? 80 or 82 tracks?
>normal or twisted? single or double sided?

You should format it 80 track, 9 sec/track, non-twisted. This will replicate
the standard DOS DSDD format. Then write the DOS bootsector.

>
>How would the MSDOS HD drive read it? Or does it matter? That it only needs
>that MSDOS executable boot sector... (since the format of ST and IBM are the
>same)...

As long as it was not a HD disk (DOS assumes anything with a HD hole in it
is formatted HD, arrrgh!) it will read and write fine. If you want to format
a DSDD disk (720k ST style) on a HD drive, type "format b: /t:80 /n:9" and
it will produce an ST readable disk (given that you have a DS ST drive).

On several occasions, I have "fixed" DOS disks that were unreadable on a
HD drive by merely taping over the HD detection hole on the disk. The reason
this worked is that the floppy owners had DSDD drives in their PCs, and for
some reason bought HD disks to use in them. They work fine on their machines
since the drives do not look for the HD hole (since they are only DSDD), but
if they get stuck in a HD drive they will not work!!

Someone please rewrite the MSDOS filesystem!!!

I think you have to visit 40 different folders for the bug to show itself.

Of course, foldrxxx (or the ICD host adaptor software) cure this problem
once and for all.

Gulam is the only csh (or "almost csh") clone for the ST with english docs that I have found. Okami is great, but it is a Bourne shell clone, not csh. I have never had a problem with ue, so it might be some auto folder program or desk accessory that is giving you problems.

As for CLI's being good only for programming, I would disagree. I find that complex file operations are much easier in Gulam. For general "boot up and run stuff" type use, I like Neodesk. By placing Gulam on the Neodesk desktop (I even drew a little sea-shell icon for it), I have the best of both worlds.

MS Write for the ST is supposed to be file compatible with it's PC companion,
but unfortunetely it is so buggy it is unusable. I would not spend $0.02
for it (I got it free with my ST, you get what you pay for). I did manage
to run it from floppy, but the random crashes kind of take the steam out of
it . . .

>My wife uses Microsoft Word at work, and would like to be able to run it

gulam was among the first and free, probably. it has numerous problems, but on the whole is very solid. i never use the builtin emacs or the term stuff. i prefer MicroEMACS (3.9i or so, not the 3.10 stuff) and uniterm for those things.

it also emulates unix (itself a religion :-) making it better than the early MSDOS-ish CLIs. by early i am talking circa 1985-6. i keep wanting to try okami, but have not had the time. is okami a unix workalike? does it have common things like ls, rm, pwd, etc builtin? if not, i don't think i'd be interested anyway. if so, i am. without alias, okami is of no value to me.

i suspect i will eventually settle on tcsh/MiNT/MGR, once i have the time to insure that it will operate as solidly as TOS/gulam. i also need a small bourne shell (not bash) for make and other scripting. that way i can have windows and shells, the best of all worlds, i suppose. since i have used gulam since those heady days, and it has served me extremely well (gulam, i believe, is a hindu word meaning "servant"), i have not seen a major need to switch, in spite of its problems. i don't recall every having lost data to a problem related to gulam itself. that is the ultimate robustness test, i think. the old CWRU crew (bammi, et al) deserve a lot of credit for their early and continuing work on making the ST a truly nice little development system, if UNIX is your "thing". that also can be a factor in gulam's continued use (stick with the things that made life easy early on). i know this is the case for me, at least in part. i respect those people and their early insight.

the biggest problem with gulam for me is no pipes. the TENEX stuff is of marginal value anyway (IMHO). the use of the "|" would have been better served for pipes vs its current use (which i confess i don't even remember what it is now - never used it). the other problem is no source. i have been told the source is a nightmare ("you really don't want to look at it"). this is no longer a big problem with readily available source for bash, ash, zsh, tcsh, etc. and a decent compiler/RTL (gcc).

a great CLI is extremely useful for "every-day use". it all depends on your orientation. mine is supercomputing which means UNIX which means CLI. BTW: i still use a VT100 clone in the office, even though i had a nice X terminal (which i gave to one of my people). colleagues think i'm crazy until they show up at a customer site who only has a VT100 for you to work on :-). their productivity goes to hell and mine stays the same (which is about the same if i had windows). i find "~^Z" and "fg" more than adequate windowing system for UNIX :-). and my fingers never move more than an inch. fortunately, i am a pretty good typist so this is not a problem. those without such a skill usually find point/click more productive. i have no problem with that. to each his/her own. it is good that there is a choice. i have never seen a Mac with a shell. this would be awful for me personally, though i could get used to anything (until it was not available). the lowest common denominator of all the systems i have worked on for the past 7 or 8 years has been VT100 and unix shells and i expect that to be the case for a long time. i see no reason to change (yet)...

Dave, get a grip. This whole thread is getting awfully emotionally charged for no reason.

>Yeeeah. And no professional programmers (which in this thread seems to
>mean "people who don't write demos") fit into this category.

Why are you ignoring the posts we've seen for several professional programmers, including the fellow who does satelitte control systems, and points out that there are still situations where "bumming instructions" is a highly desirable.

It seems the main objections to demo coding practices are coming from people who are upset about the fact that many demos won't run from their [hard drives][upgraded ST's][Mega Ste's] Well, I have a solution. Let's make the demos shareware. Then all the demo coders can go out and buy all these things so they can test their code on every possible machine. After all, we all know how hard it was to get info out of Atari on new machines. (Thank you, guys like JT, KB and AP, as I'm sure you guys had some influence on the making of that decision.)

You also point to programs like Cubase and SMTE Track as serious music programs written by professional programmers. Well I've got a big surprise for you. Cubase breaks every rule in the book. It goes directly for the hardware, and makes it very difficult for any Desk Accessory or other program trying to co-exist with it. You couldn't have picked a worse example. SMTE track won't work on ant accelerated machine because they tied the SMTE timing to the 68000.

Midi programs are some of the worst rule breakers out there, and the biggest problem is that it's not even their fault. You've been around long enough to not have missed the on and off thread here and on the tech group about midi capture being screwed up by the keyboard interupt. Unless you had it in your kill file, you can't have helped but miss the general concensus that it was impossible to deal with without some clever rewriting of the keyboard/mouse driver. Now in an ideal world, Ken or Allan would have popped up and said " Yeah, that got a bit screwed up

in the rush to get the ST out, but here's a chunk of Atari-sanctioned code to use. We've given this to all the midi developers so at least everyone will deal with it in a consistant way " But this is not the case, and every midi programmer has been forced to fix it their own way.

This note is getting a little too long, so I won't go into the quirks in Highly respected DTP, Word Processing, and Editing Programs unless asked to continue.

>

One last thing. If this above is true, why do these people mentioned above seem to be so resentful of people expressing the joy they themselves probably felt when going throught this "phase"

(Aside: When you hear yourself telling someone they're going through a phase, don't you get a slight shudder, as you realise you're starting to sound like your parents?)

2146. comp.sys.atari.st.mint?

Newsgroup: comp.sys.atari.st
Date: 1992-03-01 15:05:32 UTC
From: sigrorn@icemark.uucp
Message-ID: <YiNhvLGMGhY@icemark.uucp>
Source record: 225139
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anybody yet been thinking on the formation of a new newsgroup,
comp.sys.atari.st.mint in which the growing number of MiNT questions and
answers could be posted?
(I do not think upon this for disliking these articles, but for I want to
have them separated from the rest, since I'm (nearly) most interested in
the MiNT-articles...)

yours,

Benedikt

From: ac999108@umbc5.umbc.edu
Message-ID: <1992Mar1.152313.7925@umbc3.umbc.edu>
Source record: 225124

Sigh... I've been playing with Mint and Mgr to get it working this time, and made it farther than I did last time I tried this. I have gotten Mgr loaded and it has the slow mouse, and I can open windows, and they even have the test> command prompt.

Now, how do I actually load anything or run anything? I feel I'm missing something obvious here, but thats what lack of sleep does to ya.. thanks.

2148. Getting to use MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-03-01 16:46:55 UTC
From: pinelr@aix.rpi.edu
Message-ID: <hx3sz1+@rpi.edu>
Source record: 225131

Hello fellow comp.sys.atari.st'ers! I have heard a lot about MiNT and
am interested in using it now that I have a hard drive! I would love to get
into some (limited) multitasking and it seems MiNT is the way to go from what
I've read here. Also, there's an Amigoid living next door to me and I'm
sick of hearing about his multitasking (but god that flicker....) Anyhow,
if someone could be so kind as to tell me _which_ files I need to ftp from
a.a I would be grateful. In other words, which files do I need to get it up
and running and which files are fluff that I won't need until later. I am
very naive about MiNT though I would love to get into it more! Email
responses to pinelr@rpi.edu. Thanks a lot in advance,
Rob

2149. Re: gulam -- the best shell

rosenkra@convex.com (William Rosenkranz) writes:

> gulam was among the first and free, probably. it has numerous problems,

I'll grant that much; it was among the first and it was free. Still, I think it could have been better. The version I had didn't look pleasing at all, and with the bugs, I just decided to move onto something I liked.

> to try okami, but have not had the time. is okami a unix workalike?
> does it have common things like ls, rm, pwd, etc builtin? if not, i
> don't think i'd be interested anyway. if so, i am. without alias,
> okami is of no value to me.

Okami has far more built-in commands than Gulam, but the implementation of aliasing is a little strange. Instead of using "alias xxx xxx" you develop functions (like C) that do what you want. This is supposed to be a better method, offering more flexability, but I'm not too sure. I prefer being able to use alias commands. If Okami could support aliasing, it would be the best shell around (in my opinion).

> a great CLI is extremely useful for "every-day use". it all depends on
> your orientation. mine is supercomputing which means UNIX which means CLI.

I have to admit that what you are saying here is true. I don't work in a Computing field, so I don't work with CLI based systems often. My past experience has all been with GUI interfaces, which is why I prefer them for everyday use. I also like the simple fact that everything is BIGGER with a GUI. I have bad eyesight, so I can lean back and still identify the on-screen images. I also don't have to worry about typing a great deal, although that isn't a consideration with a shell that can support aliasing. If I had to use CLI systems all day at work, then I suppose I would prefer to use a CLI at home. Like you said, what you are used to is what you will use. I'm getting off the topic though; the original question was why *Gulam* and not why CLI. I think the best combination of programs for a system would be this:

1. MiNt
2. Gemini (with Mupfel)
3. MiNT utilities that come with the package.

With Gemini, you have a GUI, and Mupfel gives you a great CLI. The MiNT utilities (BG, LIMIT, KILL, etc.) could allow you to control processes easily enough. I've never seen MGR, and the oly thing I know about it is that it is supposed to use a great deal of memory. Even with the setup I have now (no MiNT installed) I only have about 787K free on a 2 Megabyte machine. I'm thinking about installing MiNT again, but I'm not sure how well it will work with my Terminal program. I've noticed it doesn't work

with Tempus, or the Personal Pascal editor, or really any window-oriented
program that tries to cheat to speed things up. Even Interlink refuses
to work properly (it won't take keypresses when in on-line mode. The
keys you press show up in the buffer as if you had typed them there
instead of online.)

>smoothly as Okami, though. The main problem with Okami is that it
>doesn't offer the alias option, but uses functions instead. Mupfel does

[...]

A word of warning from somebody who got just the opposite impression
about Okami:

Regarding its features, Okami looks great. And yes, the current
version (1.4+) has an alias, even thoug I agree with the author that
the shell functions are more flexible than an alias.

However, after trying to work with Okami for about a week, I gave up,
totally frustrated. I found Okami to be extremely unstable and
sensitive against any error on my part. I had to reboot about every
ten minutes or so! Forgetting the second ` in a command substitution,
for example, caused the Atari to hang, making a reboot necessary. In
some cases, it even needed a cold start, destroying my reset-proof ram
disk. In other cases, it seemed that Okami didn't close files used in
pipes properly, causing the open file limit to be exceeded.

If you are used to Unix, don't expect " or ' or $i to work in the same
way in Okami, even though it sounds like this from the documentation.
In fact, I haven't managed to work out just exactly how these work.
Also, I couldn't get gawk to work properly in a pipe under Okami,
which is a big problem because I use gawk a lot. (And yes, I have read
the documentation that came with Okami more than once, but still found
myself pretty much lost.)

You could always blame the problems on me for making mistakes during
interactive input or in shell scripts, but a shell which needs a
reboot almost every time I make a mistake is unacceptable for me.
Hoewever, if you are the type who finds such problems a challenge
rather than a nuisance, Okami might be for you. It DOES have a lot of
features...

>sure how to go about it.. thanks..

I am revising my document entitled "So, It's Your First Time to Configure TeX for the Atari ST!". I don't have an estimated on when it will be finished, but I was hoping to have it finished today. I will be distibuting it on this newsreader. I might cross post it to the "comp.text.tex" group also.

By the way, I suggest that you look into CS-TeX. It really doesn't need an documentation because it is a self-installing integrated TeX package. It, like the TeX 3.1 that my document describes, does not cost anything to the user.

I have a Supra 20 meg HD about 5 years old. I had the power supply replaced in November of 1991. Recently I began having some I/O problems which appear to be typical of a drive needing reformatting. I sat down to reformat the drive and it wouldn't boot. I don't know how much this drive is worth to anyone so I'll take the highest bidder.

I also have an Avatex 2400 baud modem that's about 5 years old. The power supply may be going bad. I don't know how much this modem is worth to anyone so I'll take the highest bidder.

ST Software for sale (all items come with original disks and docs):

Daily Double Horseracing 5
Vampire's Empire 5
C.O.L.R. Object Editor 3

Please add $1 per software order to help cover shipping.

2157. Question about Spectrum.lzh

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 03:26:33 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <1992Mar02.032633.15713@yuma.acns.colostate.edu>
Source record: 225137

Over the weekend found a new file in the a.a.u.e /atari/emulators called spectrum.lzh with file size of 531KB, so probably is emulator for the Sinclair's (spell might be wrong, sorry) spectrum. Got it FTPed our Unix machine without problem, but the Lharc said the file is ~100 some KB compressed and 200 some K{ decompressed, and no error found. Is this file use some special compresser or there something behind the regular lharced file not visible?
The file Spectrum.txt is in German so can't tell exactly what the correct contents of the package should be.
Any hint?
Thanks
Tang

I think you're reading more emotion into what I wrote than I intended.
I'M NOT UPSET, ALL RIGHT?!?! :-) :-) :-)

>>Yeeeah. And no professional programmers (which in this thread seems to
>>mean "people who don't write demos") fit into this category.
>
> Why are you ignoring the posts we've seen for several professional
>programmers, including the fellow who does satelitte control systems,
>and points out that there are still situations where "bumming
>instructions" is a highly desirable.

I wasn't ignoring those at all -- I mentioned embedded systems later
on in my post -- very tight assembly coding is still essential for
some applications. You're absolutely right in saying that there
are still situations in which these *kinds* of techniques are
important. No argument there.

> It seems the main objections to demo coding practices are coming
>from people who are upset about the fact that many demos won't run
>from their [hard drives][upgraded ST's][Mega Ste's]

Well that's probably mostly me you've described there. I think
most people who object violently to the demo coder's work have a
problem with either 1) nonportable coding in general or 2) the
attitudes of demo coders. I was trying to get away from the nasty side
of this (personality complaints) and focus more on the "good/bad"
software argument, which I still think is an interesting and valid
thing to discuss.

We can see direct parallels between those who get violent about "lamers
who don't know what they're doing" and "people who write nonportable
and/or non-structured code." So people on BOTH sides of the argument
have similar motivations (philosophical ones, that is), at least in
some of the more vocal cases. You're making the anti-demo people out
to be some kind of thought-police, which they simply are not. (Well,
at least not more than the pro-demo people!)

Another (minor) point: My ST (the one I mentioned) is NOT upgraded in
any way, except that it has a RAM upgrade. The same programs that
don't run on it properly now didn't before I upgraded. We're not
talking FrankenSTein here.

>Well, I have a
>solution. Let's make the demos shareware. Then all the demo coders
>can go out and buy all these things so they can test their code on
>every possible machine.

I don't think you've ever released anything as shareware on the ST if you think what you've described is really going to happen. Despite reports of Jeff Minter making x-thousand pounds off Llamatron I doubt most shareware products for the ST make more than a couple hundred bucks. But that's another argument. (And yes, there are exceptions like Quick ST.)

> Midi programs are some of the worst rule breakers out there, and the

>long enough to not have missed the on and off thread here and on the
>tech group about midi capture being screwed up by the keyboard interupt.

Yeah, I'd say I've been around long enough, since I ran the vote for the creation of the group. (...tech, that is. I remember it even if no one else does; what a nightmare!) In any case, you're equating replacing the keyboard interrupt with relying on undocumented shifter behavior. They're not really in the same league of "badness" in my opinion. But you've made a good case here and I'll concede the point.

> This note is getting a little too long, so I won't go into the
>quirks in Highly respected DTP, Word Processing, and Editing Programs
>unless asked to continue.

I dunno. It sounds like you're trying to convince me that all Atari ST software is just terribly written, which I find hard to believe. As I've mentioned before there are certainly a lot of crap programs written by professional programmers, but that doesn't excuse them from being crap. There are (let's hope) plenty of applications out there that are properly written (in that they follow the rules) and hence work on all ST's and derivative machines. And I'm not siding against demo coders, I'm siding against anybody's software that breaks the rules. (Yes, HacMan II does run on a TT, since I know you're probably about to ask that. So does Snowball Fight. ;-)

> One last thing. If this above is true, why do these people mentioned
>above seem to be so resentful of people expressing the joy they themselves
>probably felt when going throught this "phase"

I don't know; why don't you ask them? I hope you don't think I'm resentful just because I'm being critical. I was the one who said they should do what makes them happy.

> (Aside: When you hear yourself telling someone they're going through
>a phase, don't you get a slight shudder, as you realise you're starting to
>sound like your parents?)

Not really, if that's what I think. In this case I was suggesting a line of thought that might lead one to write off the demo coder's general attitude. I didn't say it was my personal opinion.

If I recall correctly, ANI-ST is indeed the latest version of
Aegis, and it is PD. Seems the author got the rights to it back and then
released it. This was a couple years ago I think... (this info came from a
read.me file or a blurb in a dialogue box within the software...)

2162. FAQ - environment varaibles for G++

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 10:35:58 UTC
From: Andrew.Stratton@cm.cf.ac.uk
Message-ID: <9203021035.AA09902@v1.cm.cf.ac.uk>
Source record: 225142

To get G++ to work, you need to set the environment variables - it
took me a while to get them right, so I include my gulam.g file at the end of
this file for reference.

If this is good enough - could someone add it to the FAQ.

The file assumes that :

1. all the C and C++ binaries are in d:\gnu\bin.
2. all the C and C++ include files are in d:\gnu\include.
3. all the C and C++ library files are in d:\gnu\lib.
4. The C++ source may be anywhere (i.e. current directory).

Bye for now,
Andy.Stratton.

2164. Command Driven Shells

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 13:08:35 UTC
From: vatec@sun.pcl.ac.uk
Message-ID: <1992Mar2.130835.10233@sun.pcl.ac.uk>
Source record: 225144

I have just caught up on a load of the previous articles about command line driven shells for the Atari. In a previous post I mentioned a UNIX shell I was writing called 'SYNTH'. I recieved a LOT of mail asking about it, so I thought I would stem the tide by putting some details about it here for all to read.

Basically, since I have been using UNIX (4 years now), I have been taken by the power and flexibility of a command shell, and so set out to write my own. Now, I have only relatively recently got into C programming, and so only in the last few months have I been able to really get down to some serious shell programming. Anyway, I have set out some details of what I have done, and what I intend to do on this shell below.

.....

The shell is called 'SYNTH', and the following features will be provided by the first release, which I anticipate to be around the end of the Easter break.

1) Aliases. Aliases are, IMHO, indispensable. Who wants to go around typing
gcc window.c -o window.prg -lcurses -ltermcap -lotsofotherjunk
all the time? Nuff said.

2) Shell variables. Not to be confused with environmental variables. SYNTH allows definition of as manny variables as you want. Substitution can be suppressed by the single quotes, as in CSH and TCSH. Certain shell variables are used in addition to environmantal variables, and so shell variables can be used to extend $PATH for example. They are expanded by preceding with a dollar sign ($) as would be expected.

3) Filename completion. Pressing the TAB key will cause the current partial filename to be completed as far as possible.

4) Spelling correction. The shell will check for misspelt path sections. For example '\bxn' would be interpreted as '\bin' assuming 'bxn' didnt exist. The shell wont assume anything. It'll ask first!

5) Environmental variables - PATH for example.

6) Builtin support for regular expressions, GREP, ls, pwd, ... and about 60 of the commonest UNIX commands. HOWEVER, all builtin commands can be INDIVIDUALLY overridden, so that a better 'grep' or similar can be substituted.

No 'make' though. Sorry, but Sozobon C comes with a perfectly good make utility.

7) Built-in editor. At present this is a stripped down 'VI' editor. It provides full shell escapes - you can (memory permitting) compile your source from within the editor, and execute the result. At Pterm() you are returned to

the editor. UNIX users will appreciate the sheer indispensibility of shell escapes.

8) On-Disk UNIX-style manual for every command, plus lots of shell information. The manual index will be held in RAM - no mucking about with disks. Therefore 'man -k' can be used to suggest solutions.

9) Shell script. Basic commands, and simple control structures - while() if() for()....

10) Full redirection to disk / RS232 / Printer.

11) Full piping. Probably two modes of pipes.

i) If all the commands in a pipe are builtin, then no disk accessing will be necessary other than explicitly by the commands. A RAM cache will be used to pass data down the pipe.

ii) If a pip has a disk command in it, then some form of disk access will be required. I havnt ruled out the possibility of createing an 'on-the fly' RAMdisk expressly for piping purposes = fast piping.

12) SUB-COmmand quotes. A command can be executed and the result used in another command.. eg echo `pwd`

13) Source code will be distributed to registered users, and further suggestions are encouraged - mail me and TELL ME WHAT YOU WANT TO SEE IN A SHELL!

14) Full history list. Commandline editing with cursors, and the ability to flip through previous commands with up/down cursors.
Also !lastcommand and !!.

15) An older shell of mine, has custom GEM menus. These are fully controllable from the commandline using commands such as

```
% mkmenu Editors
% mkopt Editors Tempus \bin\tempus.prg
```

Which creates a new menu called 'Editors', places the option 'Tempus' in it, and executes the command '\bin\tempus.prg' when the option is selected. The menus are set up in such a way that the screen scrolling up will NOT corrupt the menu-bar.

SYNTH would, I think, benefit from these menus.

There are a lot of other ideas I have - these are the backbone. Please let me know what you would like to see implemented. The first release will be around the end of the Easter break. Further releases will follow.

OK, time to move the Demo's thread in a more positive direction. I
remember ages ago looking at some Amiga manuals (Hardware Reference?)
which had short routines for certain supervisor instructions (eg. MOVE #$,SR)
which would work on all processors in the 680x0 family. I remember being
amazed to see Stunt Car Racer (I think) working perfectly on an Amiga
with a 68020 processor card - someone explained that the use of these
processor independant patches was widespread in the Amiga programming
community. If someone could post them here then it would help all us
coders who are going to buy TT's and/or want to write TT compatible code.

Maybe one of the Amiga owners who read this conference could help?

If anyone is interested in buying the following items make an offer and
I will get back to you. Items may be sold seperately of as whole. Tell
me if your price includes S/H also.

* Atari STf broken drive unit. 3 & 8 keys on keyboard come off.

* Color Monitor.

* Haynes Compatible 3/12 baud.

* Epson 9-pin printer (can remember numbers today)

* Software
- Capt. Blood
- Hero's of the Lance (no rules)
- Dungeon Master
- Chaos Strikes Back
- L.S. Larry II (no rules)
- StarGlider II (no rules)
- Gunship

Not working but may with some Disk Doctor program (no guarntees)

- Leatherneck
- Hardball
- Airball

I have no idea what the above items should go for but make an offer as
I am not using any of the unit and am in need of cash.

2169. UPDATE ***** Atari 1040STf System for Sale *****

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 15:53:15 UTC
From: tdoom@bgsu.edu
Message-ID: <9486@bgsuvax.bgsu.edu>
Source record: 225032
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

Greetings. Thanks to everyone who responded to my previous message.

On the advice of many of my peers in the ST community, I have reevaluated my pricing on the 1040ST system that I posted a couple days ago. So here are the new prices.

1040STf 4meg RAM (Zubair Z-RAM 3-D)
3 1/2" Floppy
Mouse $400
Extra Mouse $ 15
SM124 Monochrome Monitor $ 85
SC1224 Color Monitor $110
Monitor Master $ 15
85 Meg HD (ST296N)
ICD Host Adapter Plus
D&P Under Monitor Case $550
Casio HT-700 MIDI Synth $150

TOTAL $1325

But, because of my fondness for round numbers, $1300 will do it. So, if you're looking for a good Motorola based computer system decked out for programming, MIDI work, and general fun, this is it.

dmb> Aliases. Did I mention file name completion?

Yes you did, and I LOVE IT!!!

dmb> I've got a simple gulam alias so I can type "k" to make. You can't get
dmb> any simpler than "vi, fix bug, k, run program, vi, fix bug, k, ..."
dmb> without using an interpreted language. I'm not interested in touching
dmb> my mouse when I program since it's slower than typing "k." 1/2 :)

This does not show gulam's other utilities. I use the much more
simpler sequence: "fg, fix bug, !m, run program, ...." Here "fg"
brings me back to gulam's editor "ue" in the current buffer that I am
debugging at the current postion that I am interested. "!m" use
gulam's history to rexecute the last "make" with all its arguments.
Most often, I use "!" again to rerun the program test.

dmb> (Though the new shell that was recently mentioned here sounds
dmb> very good. I've been meaning to try it out.)

Yes, I also mean to try it out some day, rsn.

I read a note on Genie claiming that the date on the TT is calculated
relative to 1950 and so leap years are not computed properly. I guess
your TT will add and extra day in 1994. My TT has TOS 3.6 and I did not
have this missing day problem. Perhaps only older TOS's have it?

|>
|>Ditto.

There is an advertisement in the Feb 92 ST Informer mag(a U.S. mag)
for this beasty. It is (will be) called, GEMULATOR, and is produced by Branch
Always Software of ST Xformer fame. The ad says price will be under $200(US).

System requirements:

DOS compatible PC with 386 or 486 processor.
4 Meg memory
VGA card and monitor
3.5 floppy and hard disk.

For further info

I have the following items for sale for the Atari ST :

CALAMUS - desktop publishing program $110

CALAMUS Outline Art - allows you to draw pictures $100
for CALAMUS

CALAMUS font editor - Allows you to create and edit $50
fonts.

These items CAN be re-registered to the new owner.

I still have the following items for sale:

ST Computer

Atari 1040STf Computer
- 1MB Ram
- Internal double-sided floppy
- Original ST mouse (left button a bit insensitive, but works fine)
- Excellent condition
- $280 or make an offer

ST Programs

Except where noted, all the programs come with original disks,
manuals, and boxes and are in excellent condition (some rarely used).
Prices include shipping.

Games:
$ 6 Black Lamp
$ 6 Warlock
$ 6 Cosmic Relief
$ 6 Airball
$ 8 Rick Dangerous I
$ 5 Garfield (No Box)
$10 Space Quest III
$15 Kings Quest IV
$ 7 Bubble Ghost
$12 Mindscape Adventure Tri-Pack (No Box)
- Shadowgate $5 if separated
- Uninvited $5 if separated
- Deja Vu $5 if separated

Other:
$15 Publishing Partner
$ 5 Flexcessory (No Box)
- Use programs as accessories

Bare Hard Drive and RLL Controller - $180 + Shipping (Firm)

NEC D3142 42MB MFM/65MB RLL Hard Drive
- Small 3.5" size
- includes brackets to make it fit full size openings
RLL Controller
- Controls 2 Hard Drives, 2 Floppies

Does anyone have mgr runing on the TT. I just got a TT and I have to say that
Mint and the TT go great together. But, When I try to start mgr I get a
Buss Error. Is this a problem with mgr or am I missing something obvious?

Thanks for your help,

Craig

2180. RE-ORG !

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 20:02:10 UTC
From: ddv@unix.brighton.ac.uk
Message-ID: <1992Mar2.200210.5960@unix.brighton.ac.uk>
Source record: 225010

RE-ORG the disk defragmenter, has trashed my (errored) E: partition TWICE now and it's not funny. I have lost no data, only time.

DON'T USE RE-ORG ON A DRIVE WITH ERRORS AND ALWAYS BACKUP THE DRIVE FIRST !

IN FACT WHY NOT COPY THE WHOLE DAMN PARTITION TO ANOTHER, DELETE ALL THE FILES ON THAT PARTITION AND THEN COPY THEM BACK ACROSS - WITH A GOOD CACHE (COLD CACHE v3.5 IS BRILL !) IT'S JUST AS QUICK AND COMPLETELY FOOL-PROOF.

I'm thinking of writing my own -= safe =- file unfragmenter, (and one to find the blimmin' errors on E:) but as usual time is the problem but if anyone has any comments/ideas about these (future) developments please mail me.

Don't forget: 'It tastes all wiggly'.

(cryptic comment or wot?)

Domenico De Vitto, ddv@uk.ac.bton.unix or ddv@uk.ac.brighton.vms

PS all the above are my comments alone, so don't flame me.

>
>I would appreciate it if anyone has information as to the emulator's
>development, and REALISTIC timelines as to its availability.

Eugene, the emulator itself is already finished and runs most ST software at full speed on any 486 based machine. With the help of Quick ST or Turbo ST, you can get full speed on 386 machines. Even on a lowly 386SX most software runs at a bearable speed. Software like Prism Paint, Word Writer, GDOS/GPLUS, Degas Elite, etc has all been tested and runs just fine. I've even tested development tools and compiled ST software on the PC just fine. 360K/720K/800K and the PC's 1.44 meg floppy disk drive formats are supported, and even TOS 1.0 formatted disks (which normally can't be read on a PC) work fine. The PC's mouse functions like ST mouse, and aside from some minor keyboard changes, the PC's keyboard functions just like the ST's keyboard. Sound and MIDI are not supported for the time being, but may be later on with the help of a Sound Blaster card (which by the way is the company that former Atari exec Gregg Pratt now works for).

The emulator will be shown for the first time next month at the ACE Atarifest in Toronto. If you can make it, drop by and bring some software to run on it. The Toronto show is a test. If a lot of people like it and tell me they'd like to buy it, you could see it available within months in the $200-$300 range.

I am asking that anyone interested send a letter with their name and address to the address below and you'll be put on the newsletter mailing list.

Please do NOT send email. I don't have time to reply to all the email.

The guy who did QUICKST is the one who developed the GEMULATOR. He is supposed to show it at some show in Toronto in April to see if there is enough interest to market it. Claims it runs at full speed on 486 or 386 with QUICKST. He will invite people to try there favorite ST software on it.

2184. Book Review - Profibuch ST/STE/TT

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 20:59:18 UTC
From: ACPS7048@RyeVm.Ryerson.Ca
Message-ID: <92062.155918ACPS7048@RyeVm.Ryerson.Ca>
Source record: 224969

I would like to take Mr. J. Wine's message a little further and review the german edition. For further information on the english edition please read my other message posted in the comp.sys.atari .st conference. With the help of all ST Users the book might be published in the near future.

This is the original message that I received from Mr. Jankowski who is one of the authors. The second part is the translation to the german message (it was translated to "fit" the english language):

Mr. Jankowski writes:

Hi Mark!

Ich freue mich, dass Ihnen das Profibuch gefaellt.

Leider ist es uns Authoren bisher noch nicht gelungen, SYBEX davon zu ueberzeugen, eine englische Uebersetzung anzubieten. Ich werde Ihre Mail aber gerne zum Anlass nehmen, um eine neue Anfrage bei SYBEX-Deutschland zu starten. Vieleicht koennen Sie ja mal bei SYBEX-USA (in Kanada gibt es glaube ich keine Niederlassung?) eine Anfrage starten. Es koennen ja dann sein, da SYBEX-USA mal bei SYBEX-Deutschland wegen einer Uebersetzung anfragt!

Beste Gruesse
HDJ

Hi Mark!

I am glad that you enjoy the book (Profibuch).

Unfortunately we [authors] have not been able to convince SYBEX, to offer a english translation. However, I would like to take your inquiry as an opportunity to reopen this case at SYBEX-Germany and perhaps you could initiate an inquisition at SYBEX-USA. Per chance, SYBEX-USA might then petition SYBEX-Germany for an english translation.

Sincerely,
Hans-Dieter Jankowski

Review of the
ATARI Profibuch ST-STE-TT
by Mark Kovarski

Author(s): Hans-Dieter Jankowski
Dietmar Rabich
Julian F. Reschke
Edition : 10th Edition 1991 (September)
ISBN : 3-88745-888-5
Pages : 1492 pages
Publisher: SYBEX-VERLAG GmbH
Vogelsanger Weg 111
D-4000 Duesseldorf 30
Tel.:(0211)61 80 2-0
Telex: 8 588 163
Fax: 0211/6180227

Summary: The "ATARI Profibuch ST-STE-TT" (original title) is also refered as the "Atari Bible" which provides in-depth information on all series of Atari computers and is a must for every programmer and enthusiast.

REVIEW:
Over the last few months I have seen discussions going on several different conferences and different networks. The contents ranged from "What are the TT resolutions?" to "How many HD's can the SCSI-adaptor on the MSTE run?". Question like this can be easily answered if you have access to the ATARI Profibuch ST-STE-TT. The book consists of 1492 pages which are devided 5 parts. They are:

PART 1 - TOS - The Atari Operating System
PART 2 - The Hardware
PART 3 - The Hardware of the TT
PART 4 - Appendix
PART 5 - Index

Each individual part is than subdivided into different chapters. The are as following:

PART 1 - TOS -The Atari Operating System

Chapter 1: BIOS and XBIOS
Chapter 2: GEMDOS
Chapter 3: VDI-Operating System Routines
Chapter 4: AES-Operating System Routines
Chapter 5: XCONTROL
Chapter 6: Guidelines to Programming and Users Usage

PART 2 - The Hardware

Chapter 1: The Central Processing Unit
Chapter 2: The Graphics System
Chapter 3: The Sound Generator
Chapter 4: The MFP 68901
Chapter 5: The Serial Port
Chapter 6: The Parallel Port

Chapter 7: The ACIA in the ST
Chapter 8: The Floppy-Disk-Interface
Chapter 9: The Atari Computer System Interface (ACSI)

PART 3 - The Hardware of the TT

Chapter 1: Faster, higher, further - The MC68030 Processor
Chapter 2: Even Faster - The MC68882 Coprocessor
Chapter 3: ROM and RAM in the TT
Chapter 4: The TT Videocontroller
Chapter 5: And because it was so beautiful - Additional MFP in the TT
Chapter 6: A step in the right direction - The TT-SCSI-Port
Chapter 7: Serial but faster! - The SCC makes it possible
Chapter 8: The VME-Bus in the TT/MEGA STE
Chapter 9: The SCU in the TT/MEGA STE
Chapter 10: The clock in the TT
Chapter 11: Further on the TT

PART 4 - APPENDIX

Has everything from BIOS, XBIOS and GEMDOS Error messages to the pin layout of the chips. It goes even further and has much more.

PART 5 - INDEX

It is the entire index of the book with 46 pages in length.

This book is the number 1 selling ST book in germany and other european countries and it is understandably why. It has just everything you ever wanted to know about not only the ST but the STE/MSTE/STE/TT and even the Stacy computer. It is used virtually by all programmers in europe like Mr. Markus Fritze (author of Turbo Assembler), and Mr. Karsten Isakovic (author of SysMon) and many more.
The book is very structuarly organized and very easy to understand. The index is very well designed and anything can be found within seconds. The authors have also not only taken already available information and put it in the book but also double checked the existing sources and included not available information as well.
The TOS versions that are covered range from TOS 0.00 to 3.05. The are also many programming tricks and guidelines included that will enrich every programmers knowledge.
The second part which deals with the harware of the Atari series of computers has a very detailed description of the parts that are inside the Atari. Many schematics are included thus making it every hackers dream to built his own paddle controller or connect a PC keyboard to the ST.
Part 3 is the new addition to this book - The TT. It goes into the TT's 68030 and all the old/new parts of this computer. As

the chapter before, schematic are also included.
The STE/MSTE don't fall short and are also detailed described in it.
As a conclusion I have to say that this book is a masterpiece of literature. Prior to this I have used the "Atari ST Internals" by Abacus Software, the " Technical Reference Guide - Atari ST, Volume 3" by COMPUTE!Books, and the "Atari ST GEM Programmer's Reference" by Abacus Software. Even though you'll be able to find the information in all three books, you won't be lucky in obtaining any information on the STE,STE or the TT. They are just to outdated and cover only the ST computer. I have used the "Atari Profibuch ST-STE-TT" for a while now and I am truly amazed at the quality of it. It is surprising to see a book of this magnitude for the Atari since I am usually used to seeing similar literature only for the PC. The authors have done an outstanding job and hopefully a english edition will be published soon so the english readers can enjoy it as much as I did.
If you have comments/question please feel free to mail them to me.
Sincerely,
Mark Kovarski

2185. Disk Labeler

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 21:20:06 UTC
From: bossoj@nuge103.its.rpi.edu
Message-ID: <l54s7xq@rpi.edu>
Source record: 225007

I`m looking for a disk labeler for my 3 1/2" disks. I deleted the only copy
of the one I was using previously (should've made a backup!).
I believe the name of it was LABELJRB.PRG or something similar.

I'm looking for a program that is simple to use (i.e. stick the disk in the drive,
hit a key, and out comes the label.) The program I mentioned above does this,
it is in the public domain (i'm pretty sure), and I would appreciate it if anyone
could upload it for me, or something else that will do the same.

Oh yeah, it also must be able to read from drive B:.

Thanks.

The base year in the clock chip was inappropriate with respect to the
leap-year computation routines. The problem was resolved with the
latest TOS revision level.

From Microsoft for example.

PS
You can save "ASCII" in first word+ which is nearly identical to
PC ASCII. The latter is easy to convert to Mac.

^^^^^^^^^
Why would anybody pay this much for this product? For $100 more you
can get a full-feature(sound, MIDI, everything else), fully-compatible,
correct-speed(not all programs are supposed to run as fast as possible, some
are written to run at 8MHz 68000) STe. Note this is also an 'E', not just
an ST.

Also how is this product legally possible?
a) Branch Always re-wrote GEM/TOS in a clean room
environment. (not likely)
b) The Atari ROMs are included with this product.
(doubtful)

In article <1992Feb28.190307.19855@cs.mcgill.ca> someone writes:

>Well, I'm currently working on such a program.

The original problem can be solved by formatting a floppy on the
compatible and using it on both systems. Just don't use two such
floppies on the ST, one after the other, cause they might have the
same serial number. If you must use two PC floppies, slip an ST
floppy into your ST inbetween. (sort of like double clutching :-).

Someone mentioned DCFORMAT, to run on your ST. Fine, that will do, too.
Two other programs that will work are
PS2FORM
IBMFMT
Both of these are on Atari.Archives.UMich.edu.
My hope is, if someone goes to the effort of writing yet another
floppy formatter, that it should provide some needed new feature.

At the moment, I can't think what that might be.

Shortly after I got my ICD drive, I had problems of an intermittent nature. I opened the box and fiddled with the connectors. The problem went away and I have been a happy user for a couple of years now. I believe that the connectors that were the worst offendors were from the power supply to the hard drive.

I hope your problems are so simple.

> calls to the Fileselect() routine instead of
> doing it like everyone else? Hmm....
The Desktop always uses direct jumps into all functions...

> Turbo ST doesn't work. No surprise here, I guess I'll just
> have to switch to Quick ST. Oh well :-)
Forget about those (censored) Line-A-Speeders like Turbo ST, Quick ST. Get
NVDI from Bela instead. It offers as much speed as Quick ST or Turbo ST,
but is more compatible like these two (ever tried to run .TOS or .TTP
programs in Gemini's Mupfel window while QuickST/TurboST were active?) and
has a GDOS build in.

> Anybody else have any comments?
I think you've forgotten an important thing for users of a modem (or the
serial port in general). At first, RTS/CTS works without ANY patch program.
No more messing around with HSFIX, TURBOCTS, TOS14FIX or whatsoever. It just
works, even at high speed. No problems here with my HST...

Secondary, TOS 2.06 is prepared to use alternate RAM. It's going to be much
easier to have more than 4 Megs on a normal ST.

Third, TOS 2.06 is much safer when regarding accs and resolution changes.
Did you ever try Atari's new modular control panel on a ST with TOS < 2.00?
It offers a point "Switch Off" (may sound a little bit different, I only have
the German version) because resolution changes with .ACC installed on these
old TOS-Versions may cause everything (The ACCs get no information about it,
they think they have their memory, but they do not have it). On TOS => 2.00,
there are no such problems.

From: Mark Choi <mc4c+@andrew.cmu.edu>
Message-ID: <cdgfB4e00WBN86GIU4@andrew.cmu.edu>
Source record: 225016

Yes, MTOS is based on MiNT, and no, there are no problems with using PD code. If it is Public domain, you could even sell the code sans modification, there is nothing preventing you. That is why some authors use freeware instead of PD. They allow free distribution, but retain the rights.

2194. ST software for sale (mostly games)

Newsgroup: comp.sys.atari.st
Date: 1992-03-02 23:51:58 UTC
From: Michael Paul Greelish <mg20+@andrew.cmu.edu>
Message-ID: <4dgfyS600awG82ZWYB@andrew.cmu.edu>
Source record: 225017

I have the following Atari ST software for sale. I've only run this stuff on a TOS 1.0 1040ST, so STE or >TOS version compatibility is up to the buyer to determine.

Prices include shipping via USPS 3rd class, unless someone wants to pay more for something faster.

The list:

Arcticfox $12 The classic tank game from Electronic Arts.

Prime Time $15 First Row's simulation of managing a TV network.

Star Wars $10 The Broderbund arcade-derived classic.

Maniac Mansion $15 Lucasfilm's hysterical graphic adventure.

D.E.G.A.S. Elite $20 The classic paint program.
==========

Everything here is on the original disks, with *ALL* documentation and packaging. No pirating here.

If you're interested in any or all of this, email me at the address in my .sig.

Did you obtain reorg.prg with its companion program dlii and documentation? The documentation clearly states that you must use dlii first to fix a corrupted partition before running reorg. If reorg is being distributed without dlii and docs, you should notify the distributor that he/she is causing unnecessary grief and possibly data loss to unwary users.

rdf@pinet.aip.org (Robert Feinman) writes:

>I have been trying Crackart and have gotten most things to work
>except the CUT and RELAX functions. The cut does nothing and the
>Relax just beeps.

>Does anyone know how to load a .gam into the program and run it?

Have a file with ".GAM" extension in a directory "GAMES" in current dir.

The "CUT" function, I assume you mean the crop function (which is
probably called "CUT") - it cuts off all the blank area of the current
block.

And now a really obscure one:

When you rotate or resize a block, you can press HELP to have it anti-aliased.
(actually, it looks like a pixel-subdivision technique) - very good, should
be the default!

Also, press BS in rotate, and it does EXACT tiling with rotation.

(You press these buttons AFTER you've done a rotate)

The best way to find these things out is to "CHANGE" the docs then "GER2ENG"
them, then look through the docs looking for "Alt" and "Shift" and stuff -
lots of features are hidden.

2200. Word Up 3.0 update now available

Newsgroup: comp.sys.atari.st
Date: 1992-03-03 06:42:12 UTC
From: millerm@CS.ColoState.EDU
Message-ID: <1992Mar03.064212.37970@yuma.acns.colostate.edu>
Source record: 225029

Recently I uploaded WUPDATE.ARC to atari.archive. This is an update for ver. 3.0 of Word Up from Neocept. It is dated July of 1990. I have heard of a patch for ver. 3.0, to upgrade it to a higher version. I have not yet gotten ahold of it, since it seems only a few people actually have this thing. It may turn out that WUPDATE.ARC IS the patch that I and a few others have heard about. I don't know yet. This update fixes some bugs that were in the original ver. 3.0. It comes with the files that you need to replace in order to install the update. What you do is copy the files contained in the ARC file to the appropriate backup disks, then re-install it using INSTALL.PRG.

I have tried this on my own ver. 3.0, and it does fix some bugs. It is more stable now, but it still has some bugs, at least from my point of view. I am running it on a Mega STe, so some incompatibilities may be lingering just because of the hardware. I can't say for sure, but it may cure other's problems completely.

It is in atari/applications/wordproc on atari.archive.

Does someone at Atari want to verify this. Somehow I don't think anyone
would, especially if it were true.

If, indeed, Atari is basing their multitasking operating system on MiNT,
will they be decent enough to compensate Eric Smith some way for all the
work he has saved them, or will they do the greedy thing?

From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Mar3.093513.5956@news.Hawaii.Edu>
Source record: 225031

CC could've have given more time to the Atari/NAMM segment, but I think that maybe too many developers (they said 17?) showed up! They had a quick peek at the Notator sequencer which claimed to handle up to 1600 tracks, of which 64 could be simultaneous and with 16 MIDI channels/track. I'm not sure how those features stack up against the software available for the Mac, Amiga or IBM PC. Demos of the Hotz Box and a direct-to-disc system were given quick takes too.

Still, I think that the interviews with all those professional musicians you mentioned (plus someone from Genesis/Phil Collins) are strong endorsements for using the Atari when your reputation's on the line.

Jack

P.S. There was another show called Silicon Valley Report right after that mentioned Atari over and over, during a news piece about the Nintendo lawsuit. It's good to see Atari advertising "the old-fashioned way": sue! :D

2204. Cuddly Demo on STe, something wrong??

Newsgroup: comp.sys.atari.st
Date: 1992-03-03 09:49:49 UTC
From: woocm@essex.ac.uk
Message-ID: <2312@sersun1.essex.ac.uk>
Source record: 225034

Just a quick question. I have just got the cuddly demo off
of a.a and demsa'ed it to my 1040STe, it appears to work fine
except for the old changing resoution problem. The menu screen starts
in low-rez and then flicks to medium res giving an ugly shadow effect.
My orginal cuddly demo disk didn't load on the STe, but this
one does. I wondered if my cuddly msa file got corrupted on the way
over or if this has appeared on all STe's?

It says "Dave StAuGas loves Bea Hablig"

I'm not sure that I've got the case of "Staugas" right -- it's a few years
since I found the message. The reason the case is mixed is because the
bytes that make up the string read like proper 68000 op-codes. If you looked
at them with a disassmbler you'd think they were legit. code. Perhaps that's
how Mr Staugas got the message into the ROM in the first place!

>
>Sound do'able? Thanks..
>

Yes, Timeworks can print PS into a file....the problem is the only way that I have found to do it is by running Timeworks from a RAM disk. Let me explain that...

I have a single floppy, MEGA ST2 system, no Harddrive....I wanted PS output to a file so I followed the installation instructions (using INSTALL.PRG) to set up my system for using a Postscript printer...this went ok.

When I booted up the system the printer dialog had no 'print to file' option.

By accident I discovered that if the system is mounted on a RAM disk, thats all the executables and fonts etc, the printer dialog DOES contain a 'print to file' option! All I wanted to do was make it run faster without the 'disk swapping'. I assume this might also work for a system installed on a Hard disk. Seems to me that GST assumed that ONLY people with a Hard drive had a need to print PS to disk file.

I've used the PS files from Timeworks on a SUN system and they print fine. (although the PS previewer on the SUN, pageview, wasn't too keen on them) I should imagine you'll have no problems on the VAX, although it might depend on the setup of the PS printer....but I'm afraid I've no expertise in that field!...you'll just have to try and see what happens.

Source record: 225049

Does anyone fancy giving a quick summary on the various shells available?
I've only used Gulam. It seems pretty good to me, although I hate the
way it is so mouse senstitive- I usually toss the mouse off the desktop altogether.

Incidently, one of the best things I like about Gulam is probably an installation
mistake. The gulam I ftped off the net was configured for US keyboards.
This means that (on a UK keyboard) the "#" below the ENTER/RETURN key
is translated as a "~". This is v. useful if you use a PC keyboard all day.

I just avoid looking at the keyboard and type.

I would advise people to go for a SECOND disk drive instead of replacing the
internal one. It speeds things up tremendously- I use galum from my (single-sided)
internal drive and use drive B for everything else.

Some (spit) games don't like booting from drive B though.
NB There are plenty of PD "boot B" programs. Even better is the Multiface
cartridge which allows me just to power up and press 'A' or 'B' for my boot
drive :-)

Sorry, but there are bad news:
This morning I read in the German Mag TOS (yes, the Mag which includes a floppy filled up with unnecessary programs and demos of commercial sw...) in the leading article:

The Falcon does _not_ come on CeBIT in Hannover because 2 of the needed custom chips exist only as concept until now. (Thats Atari life as we all know them...).
The author of this article doubts that Atari even will be able to have a demo model of the TT040 for the Atari fair at the end of August '92.
What perhaps will be ready: The 'castrated' TT030 with 20MHz...

I cannot quote exactly from this heading article; I don't buy this mag by principle...

So, I think Atari is once more to lose market and customers...

sigh...

>(How comes it isn't the same adress in all ST's ??)

Simply use the os var _sysbase. It points to the start of the os header.

2214. Re: Question about Spectrum.lzh

Newsgroup: comp.sys.atari.st
Date: 1992-03-03 15:21:38 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Mar3162138@orion.laas.fr>
Source record: 225040

I looked at spectrum.lzh with emacs, and it seems to have 432289
useless NULL characters after SPECTRUM.TXT. After that there are
7114 binary characters which don't seem to serve any purpose.

So my question is if the uploader had any problems creating
spectrum.lzh? Here is the file recovered from a.a:

```
-rw-r--r-- 1 ralph 543222 Mar 2 16:29 spectrum.lzh
```

```
xlharc v spectrum.lzh
PACKED SIZE RATIO CRC STAMP NAME
------- ------- ------ ---- ----------------- -------------
39484 86212 45.7% 5a09 Apr 22 01:04 1987 SPECCI.DAT
37191 83806 44.3% c9b9 Apr 22 01:04 1987 SPECCITT.DAT
9006 19953 45.1% 7907 Apr 22 01:04 1987 SPECTRUM.ENG
4 4 100.0% 0000 Apr 22 01:05 1987 INHALT.INF
9008 19707 45.7% 7d9c Apr 22 01:05 1987 SPECCI.PRG
8915 20097 44.3% 0ee1 Apr 22 01:05 1987 SPECTRUM.TXT
------- ------- ------ ---- ----------------- -------------
103608 229779 45.0% Mar 2 16:29 1992 6 files
```

The reduced version with the unnecessary NULLs removed (ONE is
necessary!) is as follows:

```
-rw-r--r-- 1 ralph 110933 Mar 3 16:06 spec.lzh
```

and xlharc produces the *exact* *same* list as above.

[:-) :-) :-) Maybe this is a ploy to put atari.archive out of
business by using up extaneous disk space? :-) :-) :-)]

Even with the companion program, this is a chance you shouldn't take. I
did everything according to the documentation and it still wiped the
partition. A *MUCH* better program is Check Disk III by Atari. It will
do the same thing (but it is far more reliable) and it also has some
other really nice features.

2217. Blitz Software

Newsgroup: comp.sys.atari.st
Date: 1992-03-03 16:36:18 UTC
From: malay@sae.com
Message-ID: <1992Mar3.163618.16318@sae.com>
Source record: 225043

I was wondering if there is a newer version of TurboBlitz 2.5. The version I have sometimes can't handle the "auto" feature and only reads/writes the first track.

Does anybody have any experience using the Blitz cable & software. I tried backing up a few things but most of the copies don't work; although, I have had some luck backing up a few "protected" items.

I'm interested in hearing about your experiences using this hardware/software gizmo??

Bob Malay

> say it has good ANSI emulation, but I am not into colours, just speed..

FzDST is excelent... apart from it's ANSI emulation... it's useless.
It scrolls incorrectly when a window is set up (backwards scrolling
works ok though), it doesn't redraw the current line you're editing when
there's text after the cursor. That makes it hard to use cause you
have to request your whole page to be redrawn by the BBS you're on after
changing anything.

Craig.

>
> Please send email, as I do not want to waste any more net BW.

Well I thought i'd reply here as well in mail because you CANNOT USE
2.5 MEG ON AN STe. Well not on mine anyway :-(

I tried this one, I had 4x256K (1meg) simms in there, then I got 2x1meg
simms to up my memory a bit. I pulled out simm #1 & 3, replaced them
with the 1meg ones and powered up... the result is that the computer
appears to have checked the presence of the simms, then checked the size
of the first one * assumed the rest are the same... i.e. it thought I
had 4 megs!, and for some strange reason, you can't use memory that you
don't have!!

So, all your SIMMS must be the same, and must be in pairs of 2 (slots
1&3, 2&4), If you only have 2 simms, the have to be in slots 1&3.

All this info I just posted is true for my computer, I figured it out by
trial & error using a free memory accessory.

It's a pitty really, i've got 4 simms sitting here doing nothing that
2 of could be put to use in the spare SIMM slots i've got :-(

Craig.

I have been recently playing with Wordflair][at
a local library, and I found that if I use the justify command,
it will justify the text on the screen, but will not print
the text justified. Why is that? Also, is there a way to
use wordflair as a spreadsheet? How does it do relational
databases?

2222. Re: Portability across 680x0 family

>community. If someone could post them here then it would help all us

Since I know for a fact that the Amiga version of Stunt Car Racer is a direct port of the ST version (It doesn't even use the blitter to clear the screen between frames, let alone for filling in the track and it is noticably slower than the ST version), I would say this is more a matter of luck than the portable programming practices, which as you say, are widespread in the Amiga world. There is no reason why games should not work on the 68010 and upwards: the only incompatabilities are the MOVE from SR which I can't imagine being used in a game (And if it was it wouldn't cause problems because most games run in supervisor mode anyway), and the stuff put on the stack after an exeception, which will only affect OSs and patches to them.

>coders who are going to buy TT's and/or want to write TT compatible code.
>Maybe one of the Amiga owners who read this conference could help?

Yes, I would like to know how to get hold of the arguments to a TRAP call which was called from supervisor mode to work with the 68000 and 68010+. They start at SP+6 on the 68000 and SP+more on a 68010+ (A TRAP from user mode is OK because they always start at the USP.

Casterated?! Ouch!.

What?! 20Mhz?

Kinda reminds me of the movie "Your going the wrong wayyyyyyyyyyy!!!!!"
i.e. Wrong Way Tramiel.

Sure that wasn't something like 50Mhz or something?

20Mhz?! WHO, in thier right mind would buy such a thing???!!!

Especially now that Mr. Small's SST boards are rolling of the lines...
For about 4 megs and 40Mhz, you would spend about 1100 bucks.

I highly doubt Atari could beat that with a measily 20Mhz TT...

They never cease to AMAZE us do they? :)

>only uses 24 of them, hence the 4mbyte limit :-(

You must be joking ! The 68000 uses 23 address lines plus Upper/Lower data
strobe and is therefore able to address 2^23 = 8 Mwords of memory - that is
16 MBytes. The 4MB limit is caused by the build-in MMU (and it can be circum-
vented - a friend of mine made an expansuion which allows 15.5 MB RAM in a
normal 1040/Mega ST).

Well this argument, "I am the better programmer, much better than thou" is getting for the rest of us non-hacking/spagetti-coding BASIC lamers like myself (har har) rather boring, so I propose:

The "only-100%-portable-structured-b-trees-are-highly-sophisticated-algorithms-while-self-created-compresssion-codes-are-kidsplay-guys" get together and write a nice demo in a month. Proving that this is as easy as they suspect.

Whereas the "I-am-the-assembly-god-every-one-else-is-a-lamer-people" write a nice 100% ST-portable game ala "Hac Man" (which I suspect is portable since Dave wrote it) in the same amount of time, which must run under MiNT in all three resolutions and on all machines (how painful!!).

The net will be the judge!

2229. KWEST Atari User Group Meeting - Wed Mar 11/92

Newsgroup: comp.sys.atari.st
Date: 1992-03-03 21:59:20 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1992Mar3.215920.21093@watmath.waterloo.edu>
Source record: 225068
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In March, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
New User Help. We will also discuss the upcoming ACE '92 in Toronto
on Apr 4th and 5th and sell advance tickets.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the March issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, Mar 11, 1992

Personally, I found Darek's article in Current Notes last year about the ST user to be an insult to us all. He basically said that all ST, correction, ATARI users were stupid idiots. We should just jump on the Clone bandwagon, like he did, and forget our lowly STs.
Not only did I find this insulting but also disapointing. He was a major publication of the Atari world, which I respect greatly, publishing this obviously biased article of the ST world. If Darek hated us so much and we were that stupid, why should we invest the $200-300 to purchase his board? Why not just keep our happy little computers and let us go on our way through our world. After all, he is a CLONE user. In fact, Current Notes refered to him as an avid defender of the clone. WHy defend it, just about every pencil pusher in the US has one!
For this reason, I refused to support his QUICK ST. Now owned by the Codeheads, I have every intension of purchasing the product and suggesting it to all my stupid friends. After all, if we are so stupid, what are we doing listening to him and purchasing his products?

Mark Santora
I am proud of my own thoughts, beliefs, and what I post here.

>write a nice demo in a month. Proving that this is as easy as they suspect.

Nobody really said writing a demo was easy, at least not that I
remember. Heck, writing almost anything useful on a computer is still
pretty difficult, if you ask me. All nontrivial programs require a
serious time commitment at the very least. The argument (from my point
of view) was about whether or not being able to write a demo qualified
one as a programming god, incredibly smart, best programmer in the
universe, etc.

And B-Trees? Ick. You must be kidding. :-)

>Whereas the "I-am-the-assembly-god-every-one-else-is-a-lamer-people"
>write a nice 100% ST-portable game ala "Hac Man" (which I suspect is
>portable since Dave wrote it) in the same amount of time, which must
>run under MiNT in all three resolutions and on all machines (how painful!!).

In reference to your and Mickey Boyd's comments (which were very useful
IMHO), I suppose a few words about relevant aspects of HacMan II's
internals might be interesting to some readers. (Save this message if
you care, 'cause I probably won't ever post this info again for fear of
being thought of as a fathead for talking about my own program!) Here
goes:

HacMan II contains about 16,000 lines of C code. The C stuff controls
all aspects of the game play, like how the ghosts search for HacMan,
what happens when you eat a pill, how many points you get and when,
etc. It's what Mickey would probably call "structured code," although
it could certainly be prettier in places.

A few things are really a bit slow, but I left them that way for
readability's (or playability's) sake. An example of this is the ghost
chase algorithm(s), which got quite complicated by the time the
game was done. You'll notice that the game slows down (on an 8Mhz ST)
when several "eyes" are heading back to pen. This is because eyes are
faster and hence get to "think" more times each game turn. I left it
the way it was rather than make the ghosts stupider.

The boards are hard-coded, in that each board's setup code is
essentially one case in a big switch statement. There are about 30
function pointers (I called them "exception vectors" in the code but
they're not to be confused with the 68000's exception vectors which are

in low memory) that get called from various places when they're non-NULL. For example there's a "HacMan dies" exception (so you can make HacMan invincible), a joystick movement exception (so you can fiddle with the controls), a "pill eaten" vector, several "every game turn" vectors called at various points in the game loop, and a bunch more. You probably get the picture.

This is the real reason the game is so large; each board has code to put the monsters in their starting locations (if different from the default), load any special animations (e.g., all the aquatic shapes on boards 68 and 69), tune game paramters like ghost speed and pill duration, and install any exception vectors. Though it's about as flexible as you can get, it's not very space efficient, and it made designing boards take a lot longer than if I'd had some kind of interactive board editor and a board creation mini language interpreted at run-time.

That's the C stuff. There's a substantial amount of heavily optimized low-level code written in assembly to blit the shapes, decompress the Tiny pictures quickly, play samples, install timers, etc. This code is heavily optmized (thanks, Neil!) so the C code doesn't really have to be.

One other point: HacMan II always syncs itself to a certain number of vsyncs so that it'll run at the right speed even on faster machines. If it tried to catch every vblank by just doing a Vsync every game turn it would be unplayable on a TT or on a Dave Small 50Mhz SST. As it is I think it syncs to every fourth vblank (and probably spends lots of time sitting idle because of it). Fixing the vsync rate is absolutely crucial to writing games that run on fast machines, and it's really easy to do. (BTW, Four vsyncs is just within the limits of acceptability for games. Most commercial games probably run 3 or 4, with an occasional non-scroller coming it at 2. Catching every vsync is difficult in a program with even ruidmentary AI, especially at the NTSC (United States) 60Hz scan rate. A game like HacMan II starts out at 2 and then creeps up higher and higher as you add more and more "features" to the gameplay.)

Another bonus of vsyncing to every n vblanks is that the game runs at a constant speed regardless of what's going on. You may have noticed some games that get really fast when only 1 bad guy is on-screen but then slow down when the rest of the armada shows up. This is caused by poor selection of the vsyncing interval.

So I certainly don't advocate trying to write ST games in straight C code -- you can't. Selective optimization of some routines can produce decent results without compromising portability, readability, or maintainability too much.

(Michel Forget) writes:
>I'd like to ask a serious question; *WHY* is Gulam the CLI that everyone
>likes so much.

(In not more than 100 words :-)

I use Gulam all the time and could not live without it because:-

It has loads of built in commands that I use all the time
like cp,rm,mv,ls

It has a good (not perfect) shell script language

It has built in microEmacs. My favourite editor.

Filename completion. I wish it had command completion as well.

History.

EMacs command line editing

It's small. Some of my friends manage to use Sozobon C on a 520ST
with it.

A lot of shells provide some ofthe above features but only Gulam seems to be
providing so many. It is a matter of constant sadness to me that Prabhaker
Mateti stopped working on it.

If I were to stop using Gulam in favour of some other shell it would be nice
to have the following additional features:-

Selectable builtin commands so that we can save RAM by leaving out
the ones we don't want. A special executable format would allow
the modules to be run as normal programs or shell resident parts.

Built in disposable RAM disk. A command would make the shell allocate
some RAM for it and install a driver. Another command would destroy
the RAM disk. This would allow temporary files during compilation
to go to a RAM disk for speed but also allow the final application
to get maximum amount of RAM without having to reboot.
(I have 4Mb so this is not a problem for me but others would benefit)

A history save command that could be used before running dangerous
programs that are under development.

The PD B-boot programs are useless. The fact is that although games will BOOT from
drive B, some will always try to load their data files from drive A.
The solution I used to get round this problem was the nasty one of hooking up a
DPDT switch to pins 19 and 20 (I think) of the YM2149.

Not 'once and for all'. Just puts it off by the number of folders that
xxx
represents. Ok, set it to 999 and you probably won't hit the limit but do
you
then have any memory left to run with...

Why couldn't the foldrxxx patch have done something like print a message when
you got to the (new) limit, or even have someway of finding out just how many
folder slots have been used in a session?

Source record: 225083

Somebody asked about the Blitz Turbo Disk Copier (sorry, I lost the original file).

I have the latest version for the PC720B drive from Power, with the blitz hardware built in (no seperate cable). This claims to have the latest version of the software, but really just seems to have a new front end, and certainly doesn't copy anything earlier Blitz'z could. It's also terribly designed, so stick with the old Blitz s/w.

3 tips for better copying:
1) Use a 'fresh' disk, rather than re-formatting one.
2) Some protected stuff may work better on HIGH density disks
3) The 'auto' option defaults to 'FAST' copying. If you have something that gives info on sectors/tracks of the source disk, set Blitz parameters manually, and to normal speed.

for those who want to know what blitz is:

A disk to disk copier which bypasses the disk controller chip, rather like a tape-to-tape. Requires 2 drives and either a special cable or the custom drive I have (more convenient, good value, and boots from 'B', by the way). Both available from POWER COMPUTING(UK). For the DIY types, the ST CLUB(UK) have a disk with a wiring diagram for the cable and the necessary s/w.

If anyone wants addresses for these, feel free to mail me.

Sam.

I don't know how people can comment on Flash II, its still being written,
its nothing to do with Antics Flash at all..

Flash II is being written in OZ...

Simon Poole posted a message a week or so back, its at chsun.chuug.ch

There is a restriction on were it can be posted, he ask you to read the README first..

Here is a copy of his message...

Subject: Slightly updated version of UniTerm available
From: poole@chsun.chuug.ch (Simon Poole)
Date: 27 Feb 92 17:02:37 GMT

A slightly updated version of UniTerm is available from

chsun.chuug.ch

Directory

/archive/software/atari/UniTerm

there's a tar'ed and compressed version of the distribution and a unpacked version. (Please read the README in the directory -first-.)

I did have some problems untaring with the tar.Z file, using STTAR or ST_TAR, some funny charaters on the last folder/file, I them go hold of GNUtar from A.A. but that took some time to get it to work, one Big problem with GNUtar was it only does Line Feeds with all its Text, should it not be compatible with the Text standard used on the Atari..??

I found that the GNU Compress was OK, no problems with the Help text at all..

So can any help with the correct switches for GNUtar, I also found that arcgshell 41 did not work to well, does not have a option for k switch, comes up with no tar.out file...

> gcc window.c -o window.prg -lcurses -ltermcap -lotsofotherjunk
> all the time? Nuff said.

I have some suggestions of things I would like to see in a shell,
so I'll list them after each section that they are relevant to. (Perhaps you
or someone else cares) :^)

For Aliases, it would be nice if, after defining an alias,
it will be remembered next time one uses the shell. Instead of having
to go add a line in a .cshrc or .login file, it would be nice to just
be able to type "sa" which would save all your aliases onto a .aliases file
or something.

[2) deleted]

>3) Filename completion. Pressing the TAB key will cause the current partial
> filename to be completed as far as possible.

I always wondered if the following concept would be practical; Instead
of having to press a key such as TAB to have the filename completion
take place, and then check to see if it really worked and type more if not,
how about this: As you are typing a command to your shell, the shell displays
somewhere what it currently thinks you are going to do. To begin with, you
can say the shell guesses the filename(s) you will type. It could display
its current guess either 1) in another (light) color right "underneath" what
you are typing, in the sense that if you would continue to type, the cursor
would move over the (light) colored text of the guess (which could change)
and show (as normal shells do) what you typed. (in black). Or, 2) you could
think of having it shown at the end of the current line. The first way would
even work reasonably well at 2400 baud through modem using VT-102's "lightened
text" for the current guess. (If VT-102 or other decent terminal emulation is
not available, disable this feature, what? :-)

So, if you are typing "cat /etc/passwd", when you reach "cat /etc/pa"
in a normal shell, you would not be too sure whether it will complete or not.
With the way I am suggesting, you would know. You would see (this happens in
real-time) that right after your cursor is printed in light characters
"sswd" (with the first 's' underneath the cursor). You would then press
TAB in all confidence that it will complete that sequence. (with normal text)

Also, a system like this would give you the advantage of being able
to complete filenames that have ambiguities with other filenames: With the
normal 'press TAB and complete the filename' method, the shell will never
complete a filename that may be ambiguous. (2 or more possibilities..)
But with the method I suggest, you could always display the best choice
(which could give highest priority to the last line typed in) and if the
user of the shell notices that what is being displayed is what they want,
they can press TAB to complete that bit, otherwise type a bit more.
You could not do that otherwise. (Because pressing TAB would possibly bring
up the wrong filename, thus having to backspace over the error)

>4) Spelling correction. The shell will check for misspelt path sections. For
> example '\bxn' would be interpreted as '\bin' assuming 'bxn' didnt exist.
> The shell wont assume anything. It'll ask first!

Thats a great Idea! You could apply some of the above suggestion to
this feature too; Showing (in real-time, again) any possible spelling mistakes
the person has made in "red" (or bold) and have the line automatically re-typed
by the simple pressing of a key. [perhaps 'control-return', which is LF].

This would save an extra question such as "Change /awari to /atari?"

Sounds good. Is it written in such a way that machine dependancies can be
changed easily so that you could port it to other platforms? (e.g. Amiga, Mac
or PC)

>3) Filename completion. Pressing the TAB key will cause the current partial
> filename to be completed as far as possible.

Could you make the completion key configurable? I use Escape on Gulam all the
time and it's conveniently on the corner of the keyboard.

>4) Spelling correction. The shell will check for misspelt path sections. For
> example '\bxn' would be interpreted as '\bin' assuming 'bxn' didnt exist.

Would you give some serious thought to the RAM loadable module approach I
mentioned in my earlier post?

> Built-in editor. At present this is a stripped down 'VI' editor.

Well I'm an Emacs man myself so if you were using modules the VI editor could
be replaced.

>9) Shell script. Basic commands, and simple control structures - while() if()
> for()....

Case statements would be nice too.

>11) Full piping. Probably two modes of pipes.
>

> be required. I havnt ruled out the possibility of createing an 'on-the

> fly' RAMdisk expressly for piping purposes = fast piping.

Disposable RAM disks would be great! Not just for piping.

>) Source code will be distributed to registered users, and further suggestions
> are encouraged - mail me and TELL ME WHAT YOU WANT TO SEE IN A SHELL!

Distributing the source would good although it tends to create many versions
of the program with various improvements and seldom in the same place.
A modular extension system would avoid probelms in that respect.

>14) Full history list. Commandline editing with cursors, and the ability to
> flip through previous commands with up/down cursors.
> Also !lastcommand and !!.

Don't forget a save history command.

>
> Which creates a new menu called 'Editors', places the option 'Tempus' in it,

Again. Completely wild!

Well with a few concessions to us hard line Gulam users you could be on a
real winner here. I can't wait to try it.

On a related nore, I think 680x0 compatibility was connected with some
strangeness I encountered on a friends Amiga. (BTW: Excuse me discussing
Amigas here but this is a general 680x0 interest topic)

My friend was using an Amiga DOS equivalent(ish) command to GEMDOS Fsfirst
to get details on a file, a NeoChrome picture I had given him.

The function works by passing a pointer to the filename and a pointer to
a structure that will be filled in with the details on the file.

Anyway the problem seemed to be that sometimes the file length field was OK
(0x00007D80) and other times it was screwed up (0x7D800000). I suggested we
follow the system call through from his debugger. What the system call did
was to clear the bottom two bits of the structure pointer to allign it on
a longword boundary.

I can see how thing might speed up structure access on a 68020/30/40
processor but is useless since the calling function will still use the
unalligned pointer. His documentation neglected to mention that the pointer
needed to be longword alligned.

Have I missed something important here or was that just a waste of space?

Michel> wiped the partition. A *MUCH* better program is Check Disk
Michel> III by Atari. It will do the same thing (but it is far more
Michel> reliable) and it also has some other really nice features.

Isn't it a shame that this *MUCH* [your emphasis] better program is
*only available to developers? Why? Is it only in beta test? If it
is better Atari should release it. Developers are not the only people
with hard drives.

I would like a disk checker that when it finds a cross-linked cluster,
it would tell me in which objects it is contained (file or directory).
I currently have a cross-linked cluster in a directory, and amazingly
neither GEM nor gulam see any problems. DLII goes into a 'memory
exhausted' loop. ;-(

r> Can someone give me a brief description of this program? Is it
r>basically a replacement operating system for the ST that multitasks?

MiNT is a multitasking replacement for the GEMDOS. It gives the ability to
run more than one TOS(!)-application at the same time.

r> - What are its typical memory & disk activity requirements?

I'm using MiNT with a 2.5 MB Atari ST and a 40 MB hard-disk. It works fine.

r> - Which TOS versions is it compatible with?

MiNT "loves" TOS versions >= 1.04 because it uses routines of the original
GEMDOS, which are in older TOS-versions very buggy.

r> - Is it compatible with GULAM?

Yes.

Since Atari's Multi-TOS will be based on MiNT anyway (according to rumors...)
I think the group should better be called comp.sys.atari.st.multitasking or
something like that, where everything about multi-user OS' on the st should
go - for the time being, MiNT...

Marinos.

PS.: I don't know how nn-polls work yet, but please add my name on the
'yes' list anyway! :)

I didn't realise that the Delta Force did the Neochrome thing. The only problem is that Neochrome is copyrighted Atari code, and Neochrome Master is clearly a derivative work. This makes it illegal.

Atari UK recently wrote to all the PD libraries asking them to withdraw Neochrome from their collections. Presumably (I have no evidence) they would have issued writs if the libraries didn't comply.

Oh, and Neochrome Master crashes on my machine. It can't co-exist with a screen blanker that would also like to intercept the IKBD interrupt vector.

Unless I am mistaken, USENET is an open forum where everyone is able to express their opinions freely. You (Daniel) may not like my opinions, but neither you nor anyone else has the right to suppress them.

In the same way that you're free to voice your opinions, I will voice my "shitty atyitude" whenever I wish.

>>> fair on 11.-18. March :-)

Sorry, but a few days ago I read in the "PD Journal" (a German ST-PD mag), that Atari 99% sure will *NOT* show any 68040 machine. The only thing which should be new which the Atari Guy stated should be a low-cost TT... (Does low-cost mean even lower power? The TT is nor one of the fastest neither one cheapest machines around already...) :-(

A friend of mine which has some good connections to a lot of Atari dealers has told me that one should go to the CeBit on the *2ND* day, since Atari would show the "big" news on the 2nd day. (But don't ask me, why the 2nd).

yours,
Benedikt

As far as I read Multitasking-TOS should be *SIMILAR* to MiNT not based on MiNT
since MiNT uses a in great parts "standardized" way of how to program using a
multitasking environment. Even I heard that the MTOS should at least require an
68030, why should it do this if it would be based on MiNT? OK, OK, 8MHz 68000
isn't the fastest machine one could be dreaming of, but at least MiNT works on
such a machine well...

Let's do some history....

Tops-10, an operating system from Digital Equipment Corporation from years past (running on DEC-10 and 20 machines with 36, yes 36, bit architectures) provided

a console CLI that had command completion. It was quite good, actually, in that it would check and once you had a unique command it would just do it for you.

The only problem with this is that you might be running a program someplace that the CLI would only know by looking there.... File name completion runs the risk of taking too long on floppy diskette based systems.

> >10) Full redirection to disk / RS232 / Printer.
> >11) Full piping. Probably two modes of pipes.

This would be wonderful, but you will have it hook in at the (BIOS, XBIOS, GEMBIOS) level(s)?

All in all, a new, slim, fast shell would be very nice right about now.

What command language are you styling it after: csh, sh, bsh, ksh, VMS(TM), NOS(TM), SCOPE(TM), etc.?

Have fun! - Bob

I recently read in a german magazine that Atari's multi-TOS will be
based on MiNT!!!
Can this be true?
I hope so! :)
M.Yannikos
kdv_521@eiaida.tuwien.ac.at

This is not true, since your original Question seems to be a result
of fast reading.
It ist a pity :-(that you did not cite correctly, so I can only
hope that you meant an article in the STmagazin V3/92.
This article did not state, that multi-TOS would be BASED on MiNT,
but that it wouldn't be significant different concerning the approach to
make TOS multi, but not concerning the exact lines of code.

Furthermore it was only the opinion of the author, showing, that he
could not imagine how to do it in an other way as he already knew (from MiNT).

Please be more cautious when spreading such rumors.

>Why only 8 mhz though? Certainly 16 mhz 68000's are cheap enough not to
>make a real difference...

Yes, they are, here we have another ATARI screw up. The ST BOOK honestly sounds great, everything about it seems well thought out and the thoght of (5 to 10) hours of battery life is wonderful. Unfortunately 8mhz is too slow for most of us "serious" users, far too slow... I would guess they will come out with a 16 (or faster now?) mhz 68000 based ST book soon because of few sales. I would love to have one, but not a 8mhz :-(

By the way, you really should read my cool .sig file ;-)

I for one don't support another newsgroup. Although I have been modifying
all my PD software to work with MiNT, I also have been redesigning my
BBS software around Multi-GEM, too. (One lonely event_multi() call in a
C of TOS code....what a PAIN...)

The point being, MTOS is right around the corner. Well, maybe a couple
corners....but closer than most people think I would believe. (ie August 92).
So I would reserve the space and the money for a resident OS distributed
by Atari.

Second, without an MMU, its pretty DAM useless to support any kinda of
serious OS development.

Third, the traffic for various task switching enviroenments...MiNT, Multi-GEm,
hasn't been that great.

-Greg

This is what TOS 1.4 does, it gives a warning when you nead more memory
for folders, far better than chewing up lots of memory with folderfix...

This is not true. You CAN use 2.5Mb on ANY ST, but current versions of TOS
won't recoginise this configuration when setting the memory controler. An
AUTO folder program is available somewhere that reprograms the memory
controler when it is run, but at this stage GEMDOS has already set up its
memory descriptor list thingeys so it has to change these. I don't know
whether this is done using documented system variables (I think there is
one it could use), so I don't know how compatable this would be. I would have
to check whether it mattered which bank the .5Mb is in though.
However, the best thing to do would be to configure the memory controler

to 2Mb and use the extra .5Mb as a memory for a RAM disk. The RAM disk would reconfigure the memory controller back up to 2.5Mb just before accessing the memory and then restore it afterwards. This would give an uncorruptable RAM disk since any attempt to write to it would cause an address error.

2275. ACE '92 Update: Prizes and Banquet

Newsgroup: comp.sys.atari.st
Date: 1992-03-05 16:20:28 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1992Mar5.162028.5518@watmath.waterloo.edu>
Source record: 224958
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

The Atari Event of the Year:

On April 4th and 5th Atari (Canada) and the Toronto Atari Federation will host ACE, the ATARI Canadian EXPOSITION. This is likely the largest Atari event in North America for 1992.

To be held at the Skyline Hotel, the 1992 ACE show will feature the leading developers with the latest in leading edge software and program updates. Local Ontario dealers will exhibit the newest hardware and peripherals. User Groups from across Canada and the USA will be on hand to share Public Domain and Shareware applications.

April 4 - Saturday 10-6
April 5 - Sunday 11-6

Admission $6, $5 in advance from Atari clubs.
If clubs want advance tickets, contact TAF. Even if you can't come, buy a ticket, fill out the address portion and mail it in. It will be included in the drum for the Grand Prize Draw - think of it as a raffle ticket on a great Grand Prize!

PRIZES, PRIZES EVERYWHERE

ACE '92, the Atari Canadian Exposition to be held in Toronto on April 4th and 5th, will not only feature the latest in software and hardware, demonstrations and training sessions, but those who attend will walk away with thousands of dollars in prizes and awards.

All who purchase an admission ticket to either day of the Exposition and submit a filled out stub will be eligible for Door Prizes throughout the day they are attending. Although a complete list of door prizes is not available at this time, prizes will include software, hardware and a wide range of accessories. A sample of the kinds of prizes available includes four copies of the Essentials Set, a 5-disk collection of accessories and programs that all ST Users should have, from the TAF library. And once each day, a full year's membership in TAF will be awarded. A hard disk has been donated by ABCO Computer Consultants in Florida. Dorothy Brumleve has donated a copy of KidPublisher Professional, and Sudden Inc. is offering four copies of the student version of SuddenView. A Lynx II game and cartridge is the gift of Click Here, and Mission Software is

providing copies of Flash II, Printer Initializer, and lottODDS, a lottery selection program. Fair Dinkum's Crossword Creator II, Word Search Creator, and Cryptographer will be given away, as will EdHak 2.3 and Metapsychology Primer. The list goes on.

Besides making the entrant eligible for Door Prizes, each filled out stub will also be part of the Grand Prize Draw, the last event of ACE '92. The Grand Prize package is a complete computer set-up, including:

1) a Mega2 STe with a 50 meg hard drive and mono monitor, contributed by Atari Canada.

2) a Stow-A-Way computer table, a 30"x42" computer desk with a height adjustable base that fold for storage and an adjustable stool. Donated by Pi Precision Importing Inc.

3) The new Calamus SL, the outstanding Desk Top Publishing Program for the Atari. Donated by ISD

The ACE Talent Show is a featured event that will let Atari users display their creative skills in Graphics and the field of music and MIDI. From those demonstrating and performing on Saturday, April 4th, 3 finalists will be chosen in each division. They will be invited to attend the Gala Banquet on Saturday evening as guests of Atari Canada, and will again present their creations to the assembled banquet guests. A special panel of judges will then award the three prizes in each division:

1st Place - $700 Gift certificate and one year membership in the Toronto Atari Federation (TAF). 2nd Place - $200 Gift certificate and 10 disks from the TAF Library. 3rd Place - $100 Gift Certificate and 5 disks from TAF Library.

One of the Games Areas that promises to be busy throughout both days of ACE '92 is the LYNX CHALLENGE, where dedicated games players will compete against the computer, and where each day's high score will win a complete LYNX system, including AC Adapter and a selection of cartridges. All proceeds from the LYNX CHALLENGE as well as the GAMES TESTING AREA go to support Sick Children's Hospital, so in this area, truly everybody wins!

ACE '92 is co-hosted by the Toronto Atari Federation, a volunteer computer club. Over 100 volunteers will donate their time and energy to make this exposition and all its many activities take place, and Atari Canada has established a special prize for which only volunteers are eligible. All who work at least one shift for ACE '92 will be entered in a special draw for a A 1040 ST with a colour monitor that will be awarded just prior to the Grand Prize Draw on Sunday evening.

For an up to date list of those attending, exhibitor kits, display advertising rates, Talent Show entry forms or any other

ACE information, see contact information below.

GALA BANQUET WILL HIGHLIGHT ATARI EXPOSITION

One of the highlights of any convention is the chance to meet and talk with people who share interests. At a major international gathering like ACE '92, the leading creators of Atari software and hardware will be present and available. ACE '92, the Atari Canadian Exposition, to be held on April 4th and 5th, will bring together the outstanding dealers and developers in the Atari field for two days of seminars, sales and showing off.

Many times, however, the press of crowds and business makes it difficult to have the kind of in-depth talk one might wish. Developers are busy, crowds make conversation impossible, and the schedule of seminars and special events puts pressure on everyone. To help people spend more time together, a Gala Banquet will be held at the Skyline Hotel on Saturday night, April 4th.

A cash bar will open at 7PM, where participants can gather for drinks and conversation. Dinner will begin at 8PM, and will feature Filet of Beef Wellington with Madeira sauce, accompanied by Almond Beans, Carrots and Cauliflower. The Appetizer will be a Seafood Cocktail, followed by Tomato and Fennel Bisque. Dessert will be Fresh Berries Romanoff.

Following dinner, the finalists in the ACE Talent Contest will present or perform their entries. Selected from presentations made during the day, the top 3 in the areas of MIDI and Graphics will show off their creations on the Atari computer. Master of Ceremonies for the evening will be Geoff Earle, General Manager of Atari Canada, who promises that the evening will also contain surprises "not advertised in advance". However, he also promises that the program will not be long, so that people will have the chance to meet and talk and share their experiences. Following the formal proceedings, a special room has been set aside for ACE participants, so that conversation and celebration can continue as long as people wish.

Cost for the Banquet is $40 (Cdn) per person, which includes all taxes and gratuities. Tickets may be obtained from Atari Canada or from the Toronto Atari Federation.

DEADLINE FOR RESERVING BANQUET TICKETS IS APRIL 1ST. Because of the commitments to the caterer, tickets must be obtained in advance, and no banquet tickets will be available at ACE '92. It promises to be one of the highlights of the week-end, but it will require advance commitment.

ACE 92 will be held at the Skyline Hotel on Dixon Road, at Pearson International Airport. Further information, exhibitor's kits, advertising rates and advance ticket sales may be obtained by contacting:

I have the following items for sale for the Atari ST :

CALAMUS - desktop publishing program $110

CALAMUS Outline Art - allows you to draw pictures $100
for CALAMUS

CALAMUS font editor - Allows you to create and edit $50
fonts.

These items CAN be re-registered to the new owner.

>might try Current Notes. I think they had quite a few mail-order
>advertisers.

I'm sorry, but that's not news, that's misinformation. There are indeed
quite a few US Atari magazines.

ST Informer, AtariUser, Current Notes, Atari Explorer, Atari Advantage,
Atari Interface, PSAN, and the on-lines: ST Report and Z*NET.

Note however that Atari Advantage hasn't shipped their first issue yet,
but I'm sure it will be out soon.

Atari Advantage's number is 503-476-3578. I think there was a special
on subscriptions, $11, but I don't know if that's still in effect.

Date: 1992-03-05 22:42:27 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <1992Mar05.224227.59672@yuma.acns.colostate.edu>
Source record: 224997

Have a Supercharger with math coprocessor installed and would like to sell them
together, all serious offer will considered.
Supercharger with software 1.4, manual, and external DC power supply.
8087-2 8MHz math coprocessor installed and working.
The system is in good condition and fully functional, it's an external box
connected to DMA port. It has 8MHz V30 for the IBM work and 1MB of its own
memory (which can also used as ST's RAM drive when it's not running DOS stuffs)
.
If interested, send offer or questions to
sytang@lamar.colostate.edu
Reason for selling: No longer need to run DOS programs.

Thanks
Tang

2287. ST software for sale (update)

Newsgroup: comp.sys.atari.st
Date: 1992-03-06 01:24:22 UTC
From: Michael Paul Greelish <mg20+@andrew.cmu.edu>
Message-ID: <Udhgb6m00awXA8xUYr@andrew.cmu.edu>
Source record: 224990

Most of the stuff I offered for sale on 2 March has been spoken for, but
I've got the following left. As before, let me say:

I've only run this stuff on a TOS 1.0 1040ST, so STE or >TOS version
compatibility is up to the buyer to determine.

Prices include shipping via USPS 3rd class, unless someone wants to pay
more for something faster.

The REVISED list:

Arcticfox $12 The classic tank game from Electronic Arts.
Prime Time $15 First Row's simulation of managing a TV network.

Everything here is on the original disks, with *ALL* documentation and
packaging. No pirating here.

If you're interested, email me at the address in my .sig.

Low-power 16Mhz 68000's are available, thanks to the failed
Mac Portable, but the cache is what draws the power... Also, most (if
not all?) professional MIDI software breaks on anything but a
plain-jane 8Mhz 68000 - for some rather arcane reasons, the MIDI
developers had to resort to the use of software timing loops in their
software [Atari decided to make keyboard/mouse interrupts a higher
priority than MIDI data, so if you don't use software loop,s you lose
MIDI data. Oops! :-]

From what I understand, the major MIDI developers are just
now modifying their software for the TT - maybe the new versions won't
be processor-speed dependent?

Yeah, this is the "right" way to do it (with tokens, that is), at least
in terms of board designer sanity. I've often thought about a HacMan III
along these lines with tokenized boards (so the actual board layout
could change from screen to screen) and a (graphical) maze editor but
I've never had the time to really get into it.

There's also the sense of "beating a dead horse" here. :-)

One has to admit, though, that it's an amazing piece of work,
especially when you consider that they didn't have source! Their
raster rotation algorithm (degree increments) is the fastest I've seen
on the ST; try comparing it to DEGAS Elite sometime. Perhaps Delta
Force should write their own painting program and incorporate the code
they've already written for NEOchrome Master into it.

Are you sure this program is only available to developers? I am not a
developer, and I downloaded the file from a local BBS (which has since
gone down). The program didn't come with any documentation and it
doesn't say that it is a part of the developers kit. Is it? (Would
anyone from Atari like to comment on this one?)

2296. The TT and the ZX81 emulator..

Newsgroup: comp.sys.atari.st
Date: 1992-03-06 09:49:37 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992Mar06.094937.5710@link-1.ts.bcc.ac.uk>
Source record: 224995

I downloaded a copy of the ZX81 emulator yesterday and decided to try it out on my TT. Wall all I can say is WOW!

The first WOW was that it worked at all, many packages use dirty trick to get some speed (eg PC-Ditto).

The second WOW was the speed. With the cache off the virtual ZX81 ran at about twice the speed of a real ZX81. With the cache on.. well all I can say is that it ran like a bat out of hell! Anyone used a ZX81 with a 10-12 MHz Z80 in it?

Needless to say, most of the games which came with it were unplayable (the pacman game takes about 1 second for the ghosts to catch the pacman after zipping around the screen a few times!).

Now where's that Speccy emulator I've heard about ? :-)

Yeah, I've seen this explained in mags.
From my point of view, if I'm going to perform open heart surgery I might
as well shell out 35 pounds and stick in a new drive.

Anyway- who plays *games*?

Normally now, RTS/CTS works right in machines with TOS 1.02 (like mine
:-), right? So, if *I* got an upgrade to TOS 2.06 I would suppose
that RTS/CTS should still work?

Comments anyone?

>folder slots have been used in a session?

Because it isn't an "active" program. It simply adds memory to the OS pool area, and then terminates, so that you run out memory later rather than sooner.

The "fix" for this problem is to buy TOS 1.4 or better. Not only does it manage the pool memory properly, but it also tells you when you've run out (this is far harder to do under TOS 1.4)

>to check whether it mattered which bank the .5Mb is in though.

This isn't quite right either. The MMU in _most_ STEs presumes that there is the same amount of memory in both banks. SIMMFIX works by reprogramming the MMU for 2MB in one bank and 0.5MB in the other. It then resets the machine, so that GEMDOS takes account of the changes. TOS only attempts to reprogram the MMU after a "cold" reset.

SIMMFIX is therefore portable across all OS versions.

There is a snag, however, that some MMUs won't accept different amounts of memory in each bank _at all_. I am unlucky enough to have one of these MMUs -- a 1040STFM manufactured in 1989 (and both shifter and MMU chips are surface mounted -- goodbye RAM expansion).

> However, the best thing to do would be to configure the memory controler
>to 2Mb and use the extra .5Mb as a memory for a RAM disk. The RAM disk would

>RAM disk since any attempt to write to it would cause an address error.

This is a neat idea, but since the MMU handles RAM refreshing, I don't think it would work -- the "hidden" 0.5MB wouldn't get refreshed (I think!).

Well, the only translation I know of is 2..3 years old (dutch). As far as I know, there are no translations of the new edition. I certainly would like to know if I am wrong (last time, Sybex Germany and the authors were very surprised to see this dutch translation, nobody knew that...)

>The authors were not able to convience their publisher to release an

It's very simple. Translating, layouting and producing books is expensive. Sybex US will do a translation if and only if they believe that there are enough customers.

>hope that you meant an article in the STmagazin V3/92.

No, he didn't. The original mail reffered to rumours found in 'Atari Journal'.
_My_ article (in 'ST Magazin') had no connection to these rumours, except
that I wrote that parts of MiNT and the other software (MW) are written
by Allan Pratt. I certainly would like to see Atari using Eric Smiths
technology, but at this point, this is a rumour.

>This article did not state, that multi-TOS would be BASED on MiNT,
>but that it wouldn't be significant different concerning the approach to
>make TOS multi, but not concerning the exact lines of code.

What I said is, that programs that don't work with MiNT are good candidates
not to run on the new TOS, because they are obviously (1) depending on
undocumented things and (b) not multitasking-friendly.

>
>Furthermore it was only the opinion of the author, showing, that he

Hi there,

I'm desperately looking for an editor for my Yamaha SY22 synthesizer. This
synth is the same as its rack counterpart TG33 I believe so an editor
for this one would be just as good.
I have heard a rumour that there is one in GERMANY, so anyone who has one
(PD off course) please mail it to me. Either that or post it to the archive
a.a.u.e. and tell the world.

Thank you

Peter

A 16Mhz 68000 would obviously use more power than an 8Mhz one, but I don't
know how much more. However, Atari could easily make it switchable and still
claim "up to 10 hours battery life".
Even better, why not use a 68010 - they don't cost much more and patches
could be included into TOS.

>not available, disable this feature, what? :-)
>[...]

But this wouldn't show you all the possible completitions; I like the way the GNU readline library (as in Bash) does it; when you hit Tab, if there's an amibguity, it rings the bell, and if you then hit Tab again, it lists out all the possible completions (asking you if you really want to see them all if there are more than about 100 of them). I find this indispensible when I get half way through a command and would like to check then location of a file; I can use the completion to do asort of mini directory list, instead of having to go to the start of the line, kill it, do the ls/dir/whatever, and then yank the line back.

>>4) Spelling correction. The shell will check for misspelt path sections. For
>> example '\bxn' would be interpreted as '\bin' assuming 'bxn' didnt exist.
>> The shell wont assume anything. It'll ask first!
>[...]

Sounds great! *BUT* this might be less useful than you think, in view of the filename completion. eg. You wouldn't type \bxn, you'd much more likely have typed \bx<Tab>, found that it didn't complete, then hit <BkSp>i<Tab> and carried on. And sometimes I find myself hitting Tab in Bash on a full pathname just to check that it's correct...

Nice, but I suspect a lot of people would like it to use MiNT's pipes if MiNT
is active. Or maybe all those sort of people use Bash/Tcsh/ksh?

2309. mw2 under MiNT, tcsh alternative

Newsgroup: comp.sys.atari.st
Date: 1992-03-06 13:50:59 UTC
From: vince@sci.kun.nl
Message-ID: <1992Mar6.135059.9936@sci.kun.nl>
Source record: 224933

Newsgroups: comp.binaries.atari.st
Subject: mw2 under MiNT, tcsh alternative
Summary: Anyting faster available?
Expires:
Sender: vince@pomeron.sci.kun.nl (Sander SToks)
Organization: University of Nijmegen, The Netherlands

Hello *.*

Does anybody know whether there is a faster window manager under
MiNT than MW2? I don't have the exact figures at hand but QIndex shows
only 80% or so on pure CPU operations, and text handling is even slower.
(downto about 30%, WITH QuickST!).
I have already begun writing an alternative window manager in
machine-code, but if somebody's already done that I might as well
quit. My window manager would also include some of the nice things
promised in het README.UW-file, but not incorporated in the final MW2,
like cut-and-paste; popups instead of menubar (OK, that is NOT
standard GEM and there's a big discussion about user interfaces, but
leaving out that bar saves screen space and could mean two more lines
in a maximum-height window.), maybe even control via shell commands
(real XWindow-like!) But this is all for the future.
Another thing: Is there a simple csh port for MiNT? I'd like to
have as much "real" Unix feeling as possible, for me that means vi and
csh. I could use tcsh but I find that ones memory use a bit overdone.
I don't like ksh or bash, though the online help from the latter is
wonderful.
Thanks for any info,

>Re: MINT
>
> Can someone give me a brief description of this program? Is it
>basically a replacement operating system for the ST that multitasks?

Currently it is a partial replacement for TOS, it replaces and adds to the
BIOS and XBIOS calls and adds a true priorotised (spelling?) multi-tasking
kernel to the system. It also has the ablility to add filesystem device
drivers for other types of filesystems at boot time.

If you put it in your AUTO folder GEM will run under it fine!

>
> - How would you rate it as to 'efficiency', 'bugs', etc.

Programs probably loose about 10-20% of their speed, but on the whole it's
not noticable. Bugs.. well it's still below release 1.0, but it is stable
and there are no bugs which really cause problems. Some programs won't run
under it, but that's cos the programs do "naughty" things, such as read
their parent data space etc.

>
> - What are its typical memory & disk activity requirements?

Memory.. well it'll take up about 150K in memory if you have it running
underneath GEM, but, remember when you have more than one program in memory
at any one time, memory gets gobbled!

>
> - Which TOS versions is it compatible with?

Pretty well all bar 1.0 Disk-based. It certainly works on TOS 1.2/4 and 3.05.

>
> - Is it compatible with GULAM?

Yes, Gulam will run under it, but it is not ideal as Gulum does some naughty
thigs to the keyboard map.

>
>Thanks.
> * * *
>
> What about other specific features/functions it has that are
>worth knowing about?

It has named pipes, true signals and loads of other things.

>
>-- Can you compare it to MICRORTX/PTYWIN for multitasking, if
>familiar with those Beckemeyer prgs.) --

MicroRTX is a "real-time" multitasking OS (I believe) and is quite OK, but
if you are used to a Unix type multi-tasking OS, then MiNT is far closer.
The MiNT library for GCC is getting closer and closer to the BSD "Unix" one
every day :-).

I've not encountered PTYWIN, so I cannot comment.

I have had some other, strange problems (with my Mega STE 4):
When I un-tar'ed the LPmud 2.4.5 archive (a multi-user game), a file was created with the name ".O" I think. At least, in the desktop window it appeared that way (no name, O as an extension - I mean the O was where normally extensions are placed, the rest was blank). When I tried to delete the whole folder, (that .O file was several levels deep) I got the message "can't delete folder xxxx" where xxxx was the name of the folder in which the .O file was. I could however delete the file by dragging it to the trashcan, and then the folder could be deleted. I don't think this has much to do with your problem, but it's pretty weird too...
Maybe the read-only bit is set on the folder's directory entry, but you can't change it from the desktop (and it won't show either since the folder character is shown instead). You should have a closer look at the directory entry with a disk-monitor!

Well I didn't mean that in ST Magazin the article said that MTOS will be
something like an improved version of MiNT, I meant with BASED that it
will have compatible OS calls... (ie. the same approach, as you said)
I don't have that magazine here now, but I think that's what it said...
(more or less).
Anyway, all articles in magazines are their author's opinions, aren't they?
I know that's only a rumor, that's why the subject of my posting was

"MTOS Rumors" or something similar!

Marinos..

... also, it seems quite logical that MTOS won't use MiNT's code, since it won't work without PMMU's and MiNT does!

Marinos.

WEll, for one, Neochrome master is not Illegal. They went through all the procedures to get permission. After 1 year (I think), Atari had not replied, and so they became the legal owners of Neo.Master.

But where can I find it? I've tried ftp sites and couldn't. Could some kind soul please E-mail it to me. I'll send a free copy of a program of mine in exchange :

- Extended formatter/copier (800K on Single sided disks even)
- Tetris (With special "popcorn difficulty" (The pieces blow up)
- Pong (2 mice required)
- 2 little desk acc's : - Small character printer (160 x 100 per page)
- File hider (To avoid peeking eyes on
private stuff

Thanks for anyone who will do it.

Not true...see below...you can get CHKDISK3 from Atari for $20 (along with
a bunch of other stuff). Not a bad deal all in all. And it's a great little
program.

Bob

Atari Corporation Official Announcement

I am pleased to announce that Atari is making all of the released TOS
development information available to the general public. We are making
the kit available to fulfil the needs of programmers that already have
purchased a third-party development package, Atari owners that are
curious about the 'nuts and bolts' of The Operating System, and
anyone else that wants to have a detailed understanding of TOS
software development. If you wish, you may purchase the entire kit
for $150.00 (U.S.) and also get one year of technical support from
Atari via the private Atari Developer Roundtable on GEnie, 6 issues
of the bi-monthly Developer Newsletter, ATARI.RSC, and one year of
on-going developer kit upgrades. If you wish to renew after one year,
there is a fee of only $40.00.

If you wish information on only certain aspects of Atari TOS computers, we also sell sections of the kit separately. The items that are available range from every issue of the developer newsletter since 1985, to the release notes for the exciting new STBOOK. Every detail a software or hardware developer could want is outlined, including MegaSTE/TT VME Bus specifications, STE DMA sound, FSM GDOS programming information, and more. Please see the order form for details.

You must purchase the $150.00 full kit to be eligible for on-going support. I'm sorry, but at this time, you may not purchase a part of the kit, and later "upgrade" to the support level.

Developers that are currently not registered with Atari, and have a commercial product on the market, or have a product in development, or have any other special needs requiring direct unlimited telephone support should sign up under the Atari Commercial Developer Program. There is an additional fee for this program, but there is no renewal fee required as long as you continue product development and support. (Educators, universities, and businesses may fall into this category.) Please contact Gail Bacani on 408-745-2022 for more information on the Commercial Developer Program.

The complete order form follows, outlining all of the documentation that is available. Please note that several items include disks containing software relating to the documentation. We want to assure that you get the most out of your Atari Computer experience!

Sincerely,

Bill Rehbock,
Director of Technical Services, Atari Corp.

Atari TOS Developer's Kit -- Order Form -- January 4, 1992

_____ $150.00 Complete Developer's Kit, including all documents and disks. Includes 1 year of support via Atari-RSC Developer Roundtable on GEnie, on-going developer kit updates for 1 year, and 6 issues of ATARI.RSC, the bi-monthly developer newsletter.

_____ $40.00 One year renewal fee -- 1 year of support via Atari-RSC Developer Roundtable on GEnie, on-going developer kit updates for 1 year, and 6 issues of ATARI.RSC, the bi-monthly developer newsletter.

I've got FzDT, yes, it is good, although it DOES NOT do ANSI properley,
well as far as I can see it doesn't unless I missed out some setting
somewhere.
When using an online editor on a SL BBS, using Full ANSI, it creates a
window on your screen, and sends scrolling info to your computer.
FzDT handles reverse scrolling okay, but with normal scrolling it ignores
the window and scrolls the whole screen. That problem is not so bad, and
can be lived with, but the next one can't...
When you edit a line with text after the cursor, your term program is
suppost to update the rest of that line each time you press a key (the
BBS doesn't do it to save time), FzDT does not rewrite the rest of the
line therefore things get confusing when there is text in front of the
cursor that you cannot see (remember you're inserting text, while FzDT is
overwriting!!) You end up needing to request for a whole screen redraw
after every few keystrokes.

Anyone know of something i've done wrong, or is it FzDT???

It's Dialer is the BEST i've ever seen, 20 out of 10 points for it.
the ease of use is also great, apart from the emulation problems i've
just mentioned, i'd rate it as the best as well.

Craig.

From: ugafence@ubvmsb.cc.buffalo.edu
Message-ID: <1992Mar6.184126.11615@acsu.buffalo.edu>
Source record: 224906

To whom it may concern, I installed a TEC-bus in my Mega2 a couple of weeks ago. AND contrary to all of the previous posts, TurboST is running without a problem. I turned it off briefly to test whether it was resident but not active, and there's no question about it. The windows were slow SLOW

SLOW!!

(sorry about that, they really were slow)

The only problem I HAVE had to date is that when switching to low-res from medium, I'm getting about a dozen or so bombs. It doesn't seem to be any of my desk acc., and the only things I have in an auto folder are a harddisk driver, and GDOS. hmmm..

Whether they care to or are allowed to respond, Atari has been off the
net all week while they replace their old Vax with a TT running ASV.
It's unclear to me when they'll be back up to the point of seeing
news, athough mail is running now.

Hi there Netlanders,

i'm still in search for fax software for my ZyXEL, any ideas ???
I recently had an Phonic fax with the "incredible" ST-FAX software,
but this soft isn't able to work with the ZyXEL !
My Firmware is version 4.02 and i've tried all 3 fax compatibility-modes,
no effect :-(((

If there's any faxsoft for this modem it would be verry nice if anyone could
post where to get it !!
You still can e-mail me:

chris@alien.saar.sub.org

Thanx a lot

Christian

This seems very hard to believe -- are you absolutely certain? While NEOchrome Master may not be illegal Delta Force are most certainly NOT the owners of NEOchrome and probably not of any derivatives either. Copyright does not expire simply because the owner of the copyright does nothing with the product.

Hi,

I've got a few questions I'm hoping someone can answer. I have an STe, 4Mb, TOS 1.6. I bought it used and the only Atari Manual I have is the normal ST User's Guide, no STe addendum. I'm thinking of trying to get hold of the STe addendum I've seen referred to here. Is there good info in it, or does it just brush the surface like the ST Guide?

I'm a little fogged on the DMA Stereo sound. Can someone point me to a good source of technical info on this topic? Is it capable of producing an actual stereo image? What are some applications that make good use of this feature, or demo it's capabilities? I have gotten soundoff, and it's really neat. Anything else?

I'm also curious about sound file formats. On the archive I see mention of Soundtracker MOD files, Noisetracker MOD files, etc. I have also seen (from memory, so may be wrong) .snd, .spl, .voc(Sound Blaster), .au(Sun) I there a source of info on these different formats? Are any of them stereo? I have found the excellent PICFMTS.DOC, but have yet to find a SOUNDFMTS.DOC, or something like that. Anybody? Anybody?

Question about buzzwords: GDOS = GEMDOS?

If you are kind enough to send info, please don't feel the need to simplify. I am NOT a computer novice, just an ST novice. Thanks!

Then someone broke the agreement, I would guess. I'll stop using the
file until I become a registered developer, then. Now I have just one
more reason to become a registered developer...

Several people have pointed out that posting e-mail messages to USENET is a bad thing (some were more polite than others).

I hereby apologise to Daniel for posting his message. I still stand by what I said about it, but I fully apologise for posting it in the first place.

I have attempted to cancel the article, but since cancellation is not something the news software here handles very well...

If you are referring to Simon Poole's RE-ORG, it is released as a part of his DLII package. It includes DLII.prg, DLII.rsc, RE-ORG.prg, RE-ORG.rsc, and DLII.DOC. If your copy doesn't have the DLII.DOC, it's not legit. Simon Poole required the package to stay together.

2330. Blox -- Nifty New Game Available at atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-03-06 21:51:16 UTC
From: dmb@wam.umd.edu
Message-ID: <1992Mar6.215116.24659@wam.umd.edu>
Source record: 224807

Jeff Weiner just put my latest game up on atari archive in
atari/games/blox.arc. It's been in development on and off and has
had limited distribution since 1989; since then Blox has destroyed
hundreds of GPA's and cost tens of jobs because it's so addictive! :-)
Now YOU can get your very own copy! Such a deal!

I've included an excerpt from the doc file below. If someone with
access to CompuServe, GEnie, etc. could upload Blox to the online
services I'd be very grateful.

Have fun!

Dave Baggett
dmb@wam.umd.edu

--
What's Neat About Blox?

Aside from good ol' addictive game play, Blox features:

o Stunning art-deco graphics,
o Crisp, quick animation,
o Vibrant digitized sound, sampled at *11 kHz* for better fidelity,
o Crystal-clear sample playback on Hippo and ST Replay digitizers,
o Mind-bending hexagon motif, with six rotations per game piece,
o Cleverly selected skill levels,
o Easy-to-use configuration program that checks your Blox directory
for correctness (to ensure proper installation) and lets you set
game options, and
o Convenient hard drive support: will not clobber the OS or your installed
resolution and palette choices like most other games. Blox is a friendly
application! 8)

Blox Plus, available to registered Blox owners, has the following additional
features:

o Awesome *stereo* sound effects using STe DMA sound,
o Nifty *special* pieces like bombs and transparents,
o Challening Advanced and Tournament skill levels for Blox pros,
o and over 30 *new* 5-hex pieces.

(See the documentation for registration info.)

Try this:

```
printf "paragraph.el\tparagrap.el\tA\n" >> .dir
setenv UNIXMODE /.,LAH
```

or an equivalent statement in your favorite shell (this one is for Master, and there you should add "setenv UNIX;setenv XARGS 2" to get the right environment style and the MWC-extended argument passing method required for emacs).

>John

Hope this helps!

- Edgar

BTW: I am working on a new version (18.58) which should run under TOS/MiNT and TT and also can use my shared library for popup menus.

I'm not sure exactly what you're referring to when you say "the academic community", but I assure you it's far from a moot point in The Real World as well. Indeed, I suspect portability and maintainability rank higher with the majority of software vendors these days than do performance or even functionality. That may be an indictment on the state of the software world (or at least, the American corner of it) these days, but wishing it were otherwise won't make it change.

> after which it complained that it couldn't load "paragraph". I think
> its running into problems with paragraph.elc being truncated to
> paragrap.elc by TOS. I also tried MUPFEL, same results. Any
> suggestions?

I just installed this last week. To get it work, I edited the loadup.el file
to contain paragrap.elc, etc (about 3 others) before doing the dumps. This
works fine, since the function names are decalred inside the file, not by the
filenames.

On the subject of this version, I'm finding a few problems to do with screen
corruption. The most common one is caused when I cursor down from the centre o-
f
a line - the cursor occasionally gets placed at the start of the next line,
though as far as emacs is concerned its in the right place. Also, I'm having
to redraw the screen occasionally after some commands, though I've yet to
notice a pattern. It doesn't happen enough to be a problem, I'm just wondering-

if its just my version or is it happening to everyone?

Craft (distributed in the UK by Hisoft) does all of the above, except for
the builtin microemacs. It does come with a very nice editor.

> Built in disposable RAM disk. A command would make the shell allocate
Craft has this.

> A history save command that could be used before running dangerous
> programs that are under development.
And this. Simply echo the history to a file, then source the file when you wan-
t
to reload it.

My main criticism of Craft is that it doesn't live very well with Mint, nor
does the editor. For this reason I now use tcsh and Gnu Emacs.

2339. DMA Stereo and Sample Formats (Re: More Questions)

Newsgroup: comp.sys.atari.st
Date: 1992-03-07 01:14:49 UTC
From: dmb@wam.umd.edu
Message-ID: <1992Mar7.011449.1740@wam.umd.edu>
Source record: 224801

In article <1992Mar06.213549.25139@cdsmn.mn.org> plate@cdsmn.UUCP (Doug Plate) writes:
>I'm a little fogged on the DMA Stereo sound. Can someone point me to a good
>source of technical info on this topic? Is it capable of producing an actual
>stereo image? What are some applications that make good use of this feature,
>or demo it's capabilities? I have gotten soundoff, and it's really neat.
>Anything else?

The "DMA" part refers to the fact that the sound hardware accesses the sample data while the 68000 is busy doing other things. The main practical implication of this is that DMA sound won't slow your ST down, even at high sample rates, while normal sample playing using the MFP timers will. With MFP timing the practical sample rate limit for games is 11kHz, for example, and most games probably run sounds at around 5 kHz. (Examples: Gauntlet II, Llamatron)

The DMA sound is stereo, for real. It's actually MUCH easier to program the DMA sound than it is to produce sound through the ST's cheesy Yamaha sound chip. Stereo just means that every even numbered byte goes to the left channel while every odd numbered byte goes to the right channel. (Perhaps that's actually backwards, but you get the idea.)

There are trackers that play through using DMA sound which I'm sure the tracker enthusiasts can point you towards. The eplay program on atari.archive is a basic but robust sample playing program that lets you tweak all the hardware registers to try stuff out. I've got a new version of Play that handles the DMA sound as well, but I haven't had the time to upload it. Maybe in a few weeks.

Blox Plus (the big brother of Blox, which I just posted to atari archive) has stereo sounds with lots of gratuitous stereo panning thrown in for good measure, if you're looking for a game. There are surely commercial games that support DMA sound, but I don't know if they take advantage of the stereo capabilities. Personally, I had a huge amount of fun messing with the stereo doing the Blox Plus samples, so I don't know why game companies haven't jumped on this technology. (Maybe I'm just easily amused!) All in all, the DMA sound device is really quite nice, though I wish it supported more sample rates than the current 4.

>I'm also curious about sound file formats. On the archive I see mention of
>Soundtracker MOD files, Noisetracker MOD files, etc. I have also seen
>(from memory, so may be wrong) .snd, .spl, .voc(Sound Blaster), .au(Sun)
>I there a source of info on these different formats? Are any of
>them stereo? I have found the excellent PICFMTS.DOC, but have yet to find
>a SOUNDFMTS.DOC, or something like that. Anybody? Anybody?

There is a document on sample formats (for all machines) posted periodically, but for the life of me I can't remember where. (I know: thanks Dave!) Try alt.binaries.sounds if it still exists. Anyway, next time I see it I'll send a copy to atari.archive. The main reason I never compiled an "ST Sound Formats" is that I don't personally have access to much of the hardware and software it would cover, and I wouldn't feel right about putting out a document that I couldn't verify as at least mostly correct.

>
> -Greg

True no MMU is not good, but it DOES work, and alot of us just
cant afford another machine (between 1-ST, 1-286, 1-386, and a custom
built 68010, I dont have the $ or room space for a TT).

As for the traffic, I'd bet it would increase if it had a home
of its own (and why could it not expand to MTOS when (if) it does \
arrive ?), but I guess it is up to the masses....

2346. Spectre GCR and DEKA troubles!

Newsgroup: comp.sys.atari.st
Date: 1992-03-07 12:40:29 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <44077@ucbvax.BERKELEY.EDU>
Source record: 224850
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently complained about possible problems with the GCR in mac mode.
I think it actually is a problem with not enough current running to
all the addons. This can bode badly for the GCR's writing to Mac disks
which should be done with as much current as necessary.

---------->8 Cut Here 8<-----------------------------------

WARNING! DEKA, and GCR users!

Using Spectre with any of the IBM keyboard adapters can cause trouble
with writes onto GCR (Mac format) floppies. As the GCR draws power
to write, the DEKA shuts down because of reduced current. I don't
know if this is the case, but the logical evidence is convincing.

1) When using mac disks in mac mode, the system appears to freeze.
The keyboard seems to be locked up, though the caps lock light
goes on. This makes it appear if there is a defect with the system
software.

2) Using the shift key, control key, or alt key sometimes causes the
shifting key to "stick". This seems to happen most when more
than one shifting key is used. This seems to indicate that as
more current is used, the keyboard interface gets flakier.

3) The keyboard and mouse also stick when using GCRTEST.PRG!!! So it
happens when GCR is used in Atari mode too!

Thus I conclude that it is the pair of dreaded 74373LS ICs which must
be replaced with 74373HC ICs.

You can use 2.5 megs on a STE, you just use SIMMFIX2 in your Auto folder..

Is it locked or does it have incorrect characters in its name..

True using ST_Knife or some thing like that, its a Disk tool for
editing sectors and directories..

Or if you are using ICD hardware, try CleanUp..

> /----------------------/ Ac999108@Umbc5.Umbc.Edu /--------------------/
> /----/ Fnet#500 /-------------------/ GEnie: P.Danckaert /------------/

Well, you need a program called UUDecode (UUD.TTP) in order to get the
real file out of the encoded file. UUDecode is available at
atari.archive. One you get it just run UUD.TTP and give it the name of
the file you want to decode. If you want, (sometimes you have to) you
can cut the stuff surrounding the encoded file (message headers, text,
etc) away but this is not usually needed. If the file is larger than one
piece, you can cut them up and paste them together or you can rename them
to the names used at the bottom of each piece of the file.

I did some checking way back when the STE's first came out, the MMU
had the correct bits set, it was the OS that was incorrect..??

Well, if that is the caser then I guess I should point out that there
is a file on Atari.Archice call chkdsk3.(arc,lzh) Don't remember. It
is in the diskutils directory I think.. I saw it there a couple days
ago.

Did you use LZH201j to unpack it..?? this could be the problem, most
lzh files now use the lh5 packing method, but only LZH201x can unpack these
files...!!!

If you extract the archive with the environmental variable UNIXMODE
set properly, then the file not found errors go away. In spite of setting
UNIXMODE properly, I still can not get Emacs 18.57 working on my computer(s).
It's kinda of strange, but when I run dumpemac.ttp, non-deterministic things
happen. For instance, sometimes it says "38400 bytes of relocation information
written (9 bytes guessed)" and other times it will say "... (15 bytes guessed)",
etc... When I go to run Emacs, I get "atari is not a powerful enough terminal"
errors. If I try to run under Mint, Emacs just bombs. I've tried installing
18.57 on my old 520ST and my TT/8 using Mupfel, Gulam, msh and Bash. All with
and without Mint running. Nothing I've tried works. I've checked my termcap
file and it looks OK. I've even tried compiling the sources myself, but the
resulting executables don't work any better. I give up until someone can tell
me they got 18.57 from a.a installed and running and can tell me _exactly_ what
their configuration is and what they did to get Emacs working. I.e. How much
memory? What screen resolution? TOS version? HD partition? Mint? etc..

> systems, and other extensions to the system. It is quite
> compatible, but has trouble with some GEM programs that cheat on
> window scrolling. I'm not sure why. MiNT is not very hard on

Can you explain that -- what does it mean to "cheat on window
scrolling"?

> memory (150K I think) and it works fine with just about any
> shell. Better from a shell, in fact. There are some utilities

Which shell(s) does it run most efficiently with? I could guess
that GULAM would be one, but I've heard that GULAM doesn't
support certain MINT features, e.g., job control.

By the way, that's a great surname you've got:

- "What is your name?"
- "I forget."
- "Hmm, yes you are aren't you?"

2362. SNES to Atari SC1224 monitor help!

Newsgroup: comp.sys.atari.st
Date: 1992-03-08 00:38:30 UTC
From: gpinzone@TASHA.POLY.EDU
Message-ID: <9203080038.AA06375@tasha.poly.edu>
Source record: 224806

The April 1992 Issue of Radio-Electronics magazine explains how to hook up a SNES to an Apple IIGS, Sony, and Commodore 1804 RGB monitor.

I'd like to know how to do it on the ST's SC1224. The problem is that the ST monitor (as well as the IBM I think) has a Vertical and Horizontal Sync controls. The SNES onlt has a Sync output.

How can I get around this?

Yours truly,

2363. MiNT, TeX, MGR

Newsgroup: comp.sys.atari.st
Date: 1992-03-08 00:57:48 UTC
From: twright@umaxc.weeg.uiowa.edu
Message-ID: <11366@ns-mx.uiowa.edu>
Source record: 224923

This is my first post, so if the formatting is all screwed up please let me know.

I have a couple questions. I got copies of MiNT and MGR recently. MiNT seems to be working fine, but whenever I try to open a window in MGR is says 'can't get pty' or something similar. I only have a 1M machine. Am I running out of RAM or have I set it up incorrectly?

Also, it seems like every documentation file I get anymore is in .TEX format. What do I need to print these out? I just want something simple, I don't care about fancy fonts and such. I don't have enough space on my HD to dedicate to GDOS and a bunch of fonts either.

One last question. I have access to a Mathematica kernel running on a NeXT. Has anyone written a front-end for the ST to access it? Would it be possible? Could someone like myself (physics major) tackle it?

Help WILL be appreciated...

I doubt very much that I'll be the first to answer this question for you, but in case I am, here's the answer. To exit NeoChrome Master, you DOUBLE-RIGHT-CLICK on the eraser icon. I think you can also simply select it with the left button, and then hit it with the right.

I agree that this is ridiculous, and undocumented. Until I accidentally stumbled onto it, my method of exiting was also to reset the machine...

It's listed in the BART index, but it doesn't exist in the ls -lR
file and I have never been able to retrieve it.

I too would be very interested in obtaining a copy of this program.

Hurray! The Atari archive will stay.
But there is still dismay,
of an administrator without pay.
Leads me to say "hey."

An archive in reduced form.
Leaves me somewhat torn.
Who decides what gets thrown out?
How can we avoid a archive users' spout,
over what files need to stay?

Volunteers is what we need,
People who have advice to feed,
for the volunteer administrator's deed
of cleaning old files out.

Now the point of all this clout,
To your opinions I will route,
Keep the archive lean and clean,
Let no waste be seen,
Show restraint with ftp,
So CPU useage they do not see,
From happy archive users like me.

2367. Title/Subject: Resource files and GEM interface for GCC and G++

Newsgroup: comp.sys.atari.st
Date: 1992-03-08 04:14:06 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <10503@tamsun.tamu.edu>
Source record: 224803

I have Laser C version 2.1. It is buggy, but it does have a nice
GEM interface. It has a nice Resource File Construction set.

My question is:

Are GEM interfaces and resource contructions sets available for
G++ and GCC? I want to move towards the standards that the rest
of the people here are using, but I want to keep the functionality
that I have with Laser C.

Is there any way that I can write the programs and resource files
with Laser C and then simply re-compile them for good optimization and
MiNT compatibilty? I might be able to place the MiNT libraries in Laser C
and then quickly create very non-optimized programs.

Thanks much,
Mark Lehmann

2368. TeX documentation

> Can you explain that -- what does it mean to "cheat on window
> scrolling"?

I was talking about programs like Tempus II and the Personal Pascal editor. These programs are VERY fast when they scroll through text in their windows. Much faster than other programs. At any rate, that is the only obvious difference between those and programs that don't do super-fast scrolling (but stay alive under MiNT.)

Which shells? I'm not really all that sure about this one. I've heard it works fine under Gulam. All you have to do is use the utilities that come with MiNT that you can put in your BIN directory to support job control. The best shell to use is the one that comes with it. It has the utilities all built-in, so there is no wait.

Message-ID: <1992Mar8.172634.29945@bert.eecs.uic.edu>
Source record: 224818

Hooray! I now have a working version of Emacs 18.57 thanks to all the help I got. Turns out the problem was me not following the directions to the letter. When Scott said to set EMACSLOADPATH=/dev/f/emacs/lisp, I translated this into EMACSLOADPATH=f:\emacs\lisp. This is a definite no-no. I went back and changed all my EMACS env. variables using this new notation, redumped Emacs, and now it works!

Any ideas on how I get dired to work? When I try it I get /bin/bin/ls not found errors.

Well, I'll admit to only getting this information second hand, so it is possible that I might be wrong. But as far as I know, the copyright for Neochrome (The original) has looong expired. When Atari refused to reply, they sort of dropped off any legel recourse they could have against Delta Force should they finally decide not to allow Master to be distributed. If Atari cannot do anything, we can theoretically assume delta to be the new owners.

But then again, I might be wrong.

BTW, has anybody thought about my request for this program we're discussing ?

The Michtron base numbers are:
(408) 745-2191
3
4
5
The numbers will be gone as soon as the new net board is fully implemented. (although a lot of people are pleading otherwise!) The net seems to be 90% there, the only thing is all the files from the Michtron BBS haven't been transfered yet. The 'HOME' number will be (408)745-2196, but you will be able to call ANY Forem ST BBS (about 50 scattered accross the US & I think it's international too) & the message will get to Atari. Bob Brodie has (director of corp communications or something to that effect) been answering all queries passed his way.

Both GEM and GDOS have nothing really to do with Atari, they are both
programs/systems from Digital Research Ltd. In fact, if you look at the docs
Atari sell (the development documentation) the GEM manuals don't really
mention the ST at all, they talk about DOS and Intel chips and things such
as that!

Remember GEM was first developed for the IBM PC clones and internally I'm
sure it reflects that too :-).

Steve

PS. GEM on the ST/TT is based upon GEM Version 1 for the PC I believe, ie
before Apple took Digital Research to court over the use of overlapping
windows and a trash can.. hence GEM V.2 & 3 for the PC is crippled and
Microsoft Windows has won the GUI wars on that platform and the ST/TT's GEM
doesn't look nice and modern like MS Windows 3.x. Apple has a lot to answer
for!

| [much removed from both messages :-) ....]
|
| Let's do some history....
|
| Tops-10, an operating system from Digital Equipment Corporation from
| years past (running on DEC-10 and 20 machines with 36, yes 36, bit
| architectures) provided a console CLI that had command completion. It
| was quite good, actually, in that it would check and once you had a
| unique command it would just do it for you.

We like this feature.

| The only problem with this is that you might be running a program
| someplace that the CLI would only know by looking there.... File name
| completion runs the risk of taking too long on floppy diskette based
| systems.

A clever shell can look these things up at the beginning of a session
and can "rehash" when new commands are added.

On an Atari 1040 ST with one floppy drive, or with one floppy and a
hard drive, the Gulam shell works very well, thank you. For folks
who have grown accustomed to older operating systems that support
csh and similar shells, Gulam makes the ST livable. Did I mention
file name completion?

I look forward to tryin the new shell from the UK when it is released.

This is probably fairly obvious, but I'm not familiar with the stuff in atari.archive so could you humour me pleez?

I want to read stuff from atari.archive, decompress it on a PC, and use it later on a 520ST. I FTPed the Mint source from atari.archive and have got four files:
mint092s zoo
mint092s 3837578
mint092s 3837579
mint092s 2827580

I presume that only the last three are the actual data, but when I list the contents with Zoo only the first file is a valid archive. Trying to combine the three files doesn't help either cos then it won't read it at all!

One possible problem is that I've only got Zoo 2.01 at the moment (anyone know where I can find version 2.1 for a PC?)

I'm sure that I'm probably missing something obvious here... Should I combine the files differently, do I need Zoo 2.1, or is there something else entirely? HELP!!

Ever hopeful,
Jon Best

I have the same problem. The problem is that dired expects a working ls program (UNIX's command to list a directory) living in the directory /bin/bin. I run emacs under gulam, and it's ls function is internal, so dired doesn't know how to access it.

The solution would be either to teach dired to use gulam's ls, or to find a decent stand alone ls and either create a folder /bin/bin or change the path in dired.el.

Can anyone tell me where to find a decent stand alone ls program?

I have a 1MB 520ST for sale. This is the design with both internal power supply and disk drive (both internal). It also has an RF modulator for use with a suitable RF monitor. Also included are several MIDI oriented programs including Master Tracks Pro.

The unit is in _perfect_ condition with all original packaging and documentation. Asking $350.

|>
|> Thom
|> ~.

It's worse than that... they wire-ORed the ikbd & MIDI interupt lines together
and fed them into an edge triggered device (the MFP) with the result
that any interupt routine reading one device must read the other as well
or there is a potential for both devices to lock up - This happens on
some badly written games when you feed MIDI data in...

Then, as if this stoke of genius wasn't enough they wrote a combined ikbd/MIDI
interupt handler that takes far longer to process ikbd data than
the 320uS between incomming MIDI bytes.

Net result: Anyone who does anything serious with MIDI has to:

(a) Disable the mouse; OR
(b) Write their own MIDI/ikbd interupt handler; OR
(c) Resort to the most horribly subtle interupt hacks.

The CBHDCONF accessory (which configures Claus Brod's harddisk driver) has this function, too. However, it does only work in TOS versions below 1.4 since TOS1.4 has completely new memory management routines - it (usually) does not run out of internal memory ('folders') because it can free unused slots and due to the new routines you cannot tell how much of the memory is actually used. You can, however, add additional memory by using foldrxxx.prg - TOS1.4 will usually ignore this, and when it runs out of memory, it will look if foldrxxx installed extra memory and use this.
In most cases, you will not need foldrxxx when using TOS1.4 (and above), provided you have POOLFIX in your auto folder. In case you need additional memory, a value that is much lower than on TOS1.2/1.0 should be sufficient.

2397. MiNT's copyright status (was: MiNT and MTOS)

Newsgroup: comp.sys.atari.st
Date: 1992-03-09 20:31:33 UTC
From: ersmith@julian.uwo.ca
Message-ID: <1992Mar9.203133.14552@julian.uwo.ca>
Source record: 224842

The summary says it all. MiNT is not public domain. It is copyright
1990, 1991, and 1992 by Eric R. Smith. It *is* freeware, but if you
try to distribute it in violation of the "copying" agreement my lawyer
(who is an old friend of mine) will be in touch. In essence, anyone
trying to make money from MiNT is going to have to license it from me.

Many of the MiNT utilities, and most of the MiNT library, *are* public
domain. That means that people can sell them, give them away, or
do any other thing with them and I cannot (and would not want to) do
anything to prevent this. Many people don't seem to grasp the distinction
(witness the multitude of programs that claim to be "public domain"
and yet have restrictions on distribution), but I do and any of my
programs that claim to be PD really are (and the rest are NOT!)

As for the many contradictory rumors floating around about multitasking
TOS; suffice it to say that wild speculation about unreleased products
is rarely productive (and even more rarely accurate :-).
Let's wait and see what Atari actually produces, shall we?

>a 1040 ST ?
>

Yes, the ST Book does have the following ports: (from Atari Explorer)
- external expansion port (sorry I don't have too much detail)
- Standard parallel port
- 9-pin serial port
- mini DIN MIDI ports (I believe it comes with an adapter to
full size)
- Floppy/ACSI port (hard disks/floppy drives/laser printers)
- 10-pin keypad connection (could be anything really)

And, to answer your question, the ST Book comes with software to transfer
files via the parallel or serial port to another computer ; they said
an ST, but I'm sure it wouldn't be hard to figure out how to hook it up
to something else also...

>or something.

Not sure I like that one, mainly because I often define an alias for something-

I'm going to do a lot of times in the current session. I don't necessarily wan-
t
the shell to keep all of these. Perhaps an option to dump your current aliases-

to a file, which can then be sourced to reclaim them?

>how about this: As you are typing a command to your shell, the shell displays-

>somewhere what it currently thinks you are going to do. To begin with, you
Problems arise when you have a lot of possible completions, eg when you press
a '/' (or '\'), the shell should logically display all files in that directory-
.
If its a large directory...

>to complete filenames that have ambiguities with other filenames: With the
>normal 'press TAB and complete the filename' method, the shell will never
>complete a filename that may be ambiguous. (2 or more possibilities..)
Most shells have a key you can press to view possible completions. tcsh allows-

you to tell the shell to display all possibilities automatically once you reac-
h
an ambiguity.

>memory? What screen resolution? TOS version? HD partition? Mint? etc..

2.5meg 520 STFM, Tos 1.2. Only tried it in high res so far. Installed
on partition D. I first of all tried to do the dumps with Mint installed, and
had little success. Someone then told me to remove mint, and it all worked
fine. I dumped from the Craft shell, starting up a second version for the
second dump. As mentioned in my original posting, I edited loadup.el, but that-

shouldn't make any difference. The resultant xemacs.ttp works fine under Mint
with tcsh installed, or plain Tos 1.2 running the Craft shell. Haven't tried
it any other way. I didn't need to do anything special to my system to get it
working.

[In article <uF3BHB4w164w@admiral.uucp>,
slammy@admiral.uucp (Dave Litchman) writes ...]

> No, GDOS stands for Graphics Device Operating System, Atari's "universal
> printer driver" program. GEMDOS is just a longer word for GEM.

In most contexts, GEMDOS refers specifically to the portable, MS-DOS-like
disk operating system, not to the Graphical Environment Manager (GEM).
So far as I know, the GEM in GEMDOS is just a marketing attempt to
establish a connection with the windowing system. Both are products of
Digital Research.

TOS is composed of layers:

GEM, including
AES, Application Environment Services (windows, menubar, fsel, etc.)
VDI, Virtual Device Interface (a lower-level toolbox)
GDOS, Graphic Device Operating System (fonts and device drivers)
GEMDOS, the top-level, portable DOS
BIOS, the basic input-output system
XBIOS, Atari-specific extensions to the BIOS
BDOS, the low-level disk i/o system (used internally by GEMDOS)

TOS is a member of a family of operating systems that are descendants
(with varying degrees of legitimacy) of CP/M. Other members of that family
include Turbodos (not the Atari variety, but an old OS for Z-80s),
CP/M-86, CP/M-68K, MP/M, Concurrent DOS, DR-DOS and -- yes, it's true
-- MS-DOS and PC-DOS. GEM was designed as a graphical enhancement to some
of these operating systems, and was available for MSDOS a little bit
before the introduction in 1985 of the Atari ST.

This is USA TOS 2.06, it will take a few years to get it here in NZ
then it will cost the earth, the last TOS was $200nz fited, try the UK
it will be far cheaper there..

2413. InkJet Printers

Newsgroup: comp.sys.atari.st
Date: 1992-03-10 14:29:23 UTC
From: G.M.Humpage@bradford.ac.uk
Message-ID: <1992Mar10.142923.19106@bradford.ac.uk>
Source record: 224790

I'm considering getting an inkjet printer for my 520STfm, I'll probably get either a Canon BubbleJet Bj-10e or HP Deskjet 500.

Has anyone got any comments on using either of these printers with an ST? I would mainly use the printer with Protext, are there drivers readily available for use in conjunction with this software/hardware combination?

Could you possibly email me the results

Ta,

Guy

2414. Graphics libs for use with G++ 1.39 on the ST?

Newsgroup: comp.sys.atari.st
Date: 1992-03-10 15:19:52 UTC
From: pbh@jake.cc.wayne.edu
Message-ID: <1992Mar10.151952.10813@cs.wayne.edu>
Source record: 224756
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This summer I'd like to try producing 3-d graphics on my ST using FSF's GNU C++ compiler. Checking out Atari archive, there are two libraries, gemlib.zoo and gemolb.zoo; which one do I need? Also, are there libraries for producing graphics with MGR under Mint? I'd rather make stuff there than under GEM if possible. Also, is there any documentation for these libs? I heard once that the GNU GEM library was based on Mark Williams C and those docs may be used; c'est true?

Thanks for the info.

Hello everyone,
I got a new copy of the E. A. Brown catalog in the mail, and I was
surprised to see the Mega ST 1s selling for ~$649 (no HD). Previously
these were offered for about $1000. I think this is the same price
as a 1040 STE ($399) + AdSpeed STE ($249). I wonder if this reflects
a lower prices from Atari, or that everyone has just had a bigger
markup on them all along. I wish I had known this was coming, because
I bought a 1040 STE just a month ago.

Well, on appearance maybe. But not really.

>
>1) When using mac disks in mac mode, the system appears to freeze.
> The keyboard seems to be locked up, though the caps lock light
> goes on. This makes it appear if there is a defect with the system
> software.
>

This is *NORMAL* GCR behaviour. It has absolutely nothing to do with
a lack of current, voltage or anything else.

>2) Using the shift key, control key, or alt key sometimes causes the
> shifting key to "stick". This seems to happen most when more
> than one shifting key is used. This seems to indicate that as
> more current is used, the keyboard interface gets flakier.
>
Maybe. Could also be a problem with your DEKA keyboard. Generally
it's not nice to bang on the ST's keyboard while the GCR is doing its stuff.
Dave's done a good job of bulletproofing the code, I have absolutely
no kind of proof, but I suspect a flurry of keyboard interrupts might
still screw things up. I know there used to be a bug that locked up
the Mac if you moved the mouse too much while it booted.

>3) The keyboard and mouse also stick when using GCRTEST.PRG!!! So it
> happens when GCR is used in Atari mode too!
>

Again, this is perfectly normal behavior. Isn't it mentioned in the
manual somewhere?

>Thus I conclude that it is the pair of dreaded 74373LS ICs which must
>be replaced with 74373HC ICs.
>--
>John Kawakami kawakami@ocf.berkeley.edu
> ucbvax!ocf.berkeley.edu!kawakami

Incorrect conclusion. While you may indeed have a problem with
the bus driver chips, mouse and keyboard lockups during GCR activity
are *NOT* a symptom of that problem. Inability to write (but still can
read) Mac format disks no matter how much you tweak the pot in the GCR
is a more likely symptom. That might also point to a shielding
problem with an internal drive in a Mega. If you are not having
problems reading and writing Mac disks (aside from these 'lock ups'),
then leave your ST alone. If it ain't broke...

BTW, you didn't mention what type of ST you are using. To my
knowledge, the driver problem was primarily restricted to Mega 2's and
some Mega 4's. Hope this helps.

Source record: 224769
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Just a quicker note <grin>. I think you must of had a typo in your response, I think you meant 10's of Forem bases, NOT 100's. Look, I don't mind being corrected as long as the correction is correct. You seem to be trying to make me look way off base by over stating the number of net boards. Bob Brodie says "over 70" and a letter that was posted on Full Moon, Steve Riders Forem ST support BBS, list a total of 78 boards. Included in this is a private & as such I think that safely reduces the number to less then 100. On the bright side, I think you have a promising career developing. Jack Tramiel probably already has an eye on you for reporting ST sales. If you now of 100's of Forem NET BBS's, just add the names to the list. It will be much more constructive then just saying someone is wrong.

I've been using gulam for years and love it. I'm a vi man myself, so I don't use the built in ue. I've just aliased vi to run stevie (although stevie does have its limitations with large files).

The only part of gulam that pisses me off is if you backspace too far, you get the previous command from your history list. Does anyone know of a way to prohibit gulam from doing this?

2427. Magic Shadow Archiver

Newsgroup: comp.sys.atari.st
Date: 1992-03-10 20:02:41 UTC
From: saf@netcom.com
Message-ID: <!d2hn7bsaf@netcom.com>
Source record: 224776

A few years ago (1987) I wrote a utility for the ST called the Magic Shadow Archiver. On a whim I was searching through some anonymous ftp sites, and found my program (MSA103.lha) at a few of them. It had been altered, apparently by some kind of compression routine. But seemd to still be completely intact. I also found a MSA_141.lzh. The documentation for this program was mine, but there were two other files in the archive (NEWMSA.PRG, and SHADOW.PRG).

Since I no longer have an ST (much as I would have liked to hang on to it) I can't look and see what's really in this archive. If anyone out there is familiar with this program, perhaps you could give me a bit of background on it. Does anyone know where it came from.

Also, does anyone still use this program? If there is any demand I'd be happy to provide the source code to a competent programmer who is willing to make improvements.

Thanks.

2428. New Sections

Newsgroup: comp.sys.atari.st
Date: 1992-03-10 20:32:41 UTC
From: heidelj@coch12.alleg.edu
Message-ID: <1992Mar10.203241.15653@pellns.alleg.edu>
Source record: 224770

I would like to propose that whoever is in charge of the ST Comp.sys section of usenet reorganize the ST section into different categories. For example:

Atari ST - Communications
Atari ST - Midi
Atari ST - Hardware
etc.

The Amiga section is this way and so I propose that the Atari section also be this way.

Anybody else agree?

>I would like to propose that whoever is in charge of the ST Comp.sys
>section of usenet reorganize the ST section into different categories.
>For example:

Whomever is in charge? HA! Welcome to UseNet.

If you want those divisions, go ahead and start a call for votes. I wouldn't count on enough people agreeing with you (or even caring) to get the necessary numbers, though.

UseNet is, for the most part, an anarchy (albeit an awfully well behaved anarchy). There's nobody in charge of anything.

Jeff

2431. Dvorak

Are there any utilities out there that will remap the qwerty keyboard to the Dvorak? I've just started learning Dvorak, and if I get fast enough at it to warrant the change-over, I'd like to be able to do so on my ST.

Jeff

Nope. You are looking at the nodes registered to receive 1 crossnet base. I know that when I ran FoReM I didn't get that base.. its not required. Also, there is another program.. Turbo Board, which is a clone of FoReM, so there are more boards on that also, but they are basicially the same thing.

FoReM is one thing.. Crossnet is another. You can run FoReM fine, and not Crossnet.

how do I know this? I ran FoReM for a year or so, before switching.. (I switch programs every year or two it seems..)

Yes, I have it. I've used it a couple of times and it still seems like there a few bugs that need to be ironed out. But overall, I think it does quite well. The only thing that kind of detracts from it is that it will not append a tagline to your .REP messages like Maximiser will, but you can set up macros to do that for you...

I still have the following Atari ST and programs for sale.

ST Computer

Atari 1040STf Computer
- 1MB Ram
- Internal double-sided floppy
- Mouse (left button a bit insensitive, but works fine)
- Excellent condition
- $250

ST Programs

Except where noted, all the programs come with original disks,
manuals, and boxes and are in excellent condition.

$ 6 Black Lamp
$ 6 Warlock
$ 6 Cosmic Relief
$ 6 Airball
$ 8 Rick Dangerous I
$ 5 Garfield (No Box)
$10 Space Quest III
$15 Kings Quest IV
$ 7 Bubble Ghost

$ 5 Flexcessory (No Box)
- Use programs as accessories

>Newsgroups: comp.sys.atari.st

>Remember GEM was first developed for the IBM PC clones and internally I'm
>sure it reflects that too :-).

GEM was first developed for the 6502 line of computers, but it was 'shelved'
because it was too slow in the opinion of the creators.

>PS. GEM on the ST/TT is based upon GEM Version 1 for the PC I believe, ie
>before Apple took Digital Research to court over the use of overlapping
>windows and a trash can.. hence GEM V.2 & 3 for the PC is crippled...

GEM/2 and GEM/3 were out L-O-N-G before Apple took MICROSOFT to court. Apple
has never taken on DRI. DRI could knock Apple out in court since their system
predates theirs. (GEM is a outgrowth of the STAR system developed by Xerox.)

Both GEM and DOS are based on the CP/M operating system, but whereas DOS is
more of a 'revision' of CP/M, GEM is a 'extention' of CP/M. Because it's an
extention, it is easy to 'port' it to DOS, or to TOS. (TOS is also a revision
of CP/M.)

GEM on the IBM/PC reacts badly to that enviornment due to DOS's 640K
limitations.

I will be interested in follow-up from you once you get this question asked.
For example, while or after you have learned it, can you switch back and forth
between Dvorak and QWERT? How much does it speed you up?

Yes the is a lot of duplicate suff, and some of it is buggy, like GNUTAR.LZH
or some thing like that name in the archive directory, the one in the
GNU directory is ok, its a zoo archive, but I could not unpack the lzh one
with LZH201j..

Also there seam to be many old versions of things, like 5/6 copies
or Thomas Questers older LZH 13XX....??? only LZH201j neads to be there..

Also I fould a problem with ST-TAR, it did some funny things with the latest
Uniterm tar.Z, but I did manage to get GNUTAR to work, well I think I did..??

The SC1224 has better resolution than the SC1435, ie, the dot pitch on a SC1224 is 0.39 mm but only 0.42 on the SC1435...

The SC1435 would be ok for games but not much else..

I have just bought an Atari ST for use with C-Lab's Notator but I do not have a printer.

I do notice however, that I can save a printed file as an "image" (.img) file.

What format is this file ?

I have access to postscript laserwriters on SUN systems - does anybody know how I can convert these files to a "printable" form on SUN's ? (eg postscript)

TIA
Robin.

Source record: 224791

I could'nt wait for a "comp.sys.atari.st.mint"... A couple questions:

1) I looked all over Atari Archives for a "more" to use with MiNT (I even
took the 'more' in the MGRDEMOS.ZOO but it doesnt seem to work)
and all I could find was "atari/utilities/less.arc" which seems not
to handle CR/LF's too well.

Can someone point me in the right direction? Thanks.

3) Does Microemacs "e310" work with MiNT if I havent installed GEM yet?

LOADED AMIGA2000 for sale, quick!
All equipment is in excellent condition.

Amiga 2000 System for sale
-A2000 rev4.4 B2000 1.2 roms/512k chip(was about to get ECS)
+2 internal floppies(880k)
+mouse/keyboard
+9Megs of RAM
+80 Meg Quantum HardDrive(fast cached mechanism)
+GVP Series][HC(8/80 as above)
-Atari(JVC oem) SC1224 RGB monitor(very sharp)
-Digital Creations Supergen External GENLOCK
-Software(on the hard drive)
+JRComm,VLT,AZComm <telecomm>
+MED, Soundtracker, Noisetracker <music>
+CrossDos/DOS-2-DOS/Powerpacker/Diskmaster
+TONS of stuff on drive
+a total of about 140 floppies(40 blank, rest with misc software)
+Teakwood, rolltop diskbox for floppies
-Books(all immaculate)
+Amiga manuals(WITH front page)
+Programming the 68000 from Sybex
+Amiga Hardware Tech Reference Manual
+Amiga Interface Standard Reference Manual
+AmigaDOS 2.0 Companion Manual
-Star SG-10 dot matrix(9-pin) printer /w cable.
-Video Showmaker Software

BEST EARLY REASONABLE OFFER OVER $1200 takes it.
if I went out and bought the hardware today, without the software, the system
would probably run around 1700 probably more.I'd prefer a local buyer
who can come and pick it up but I will ship also, no problem as long as
the buyer picks up the shipping charges. everything has original boxes.

I get the same problem when running PageStream v2.1 on my color 1040ST with 1mb memory also. It seems to crash for no apparent reason. I am running it off a floppy (ack - no hard disk) so that might be the root of my problem (I have a program disk, and 5 font disks...). Do the font lists have to be on all the font disks? The manual was not too clear on what should go on what disk.

Message-ID: <2274@keele.keele.ac.uk>
Source record: 224724
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I had such a good response to my last question, heres a couple more for your perusal.

I have a monitor (OK, Ill admit it, it's a Sinclair QL Monitor, I was given it free!). I have no documentation for it but am almost certain its a simple RGB input. I want to know if I can hook it up to my atari st. I have tried just linking the R G B and a sync and get an almost recognisable picture but it is very faint and rolls a lot. Is this a voltage level problem? what can I do about it? Any suggestions appreciated.

Question two I have been trying to install Pinhead (aquired from the cover disk on Public Domain). On booting up I get the welcome message but then the ST resets, boots up again, welcome message, resets. And so on.
Anyone know what I am doing wrong??

Finally I would like details of any sites IN THE UK which archive ST software (I know about lancs.pdsoft).

Thanks in advance,

David Braziel.

2451. DTP advice needed

Newsgroup: comp.sys.atari.st
Date: 1992-03-11 13:36:43 UTC
From: mro@dcs.exeter.ac.uk
Message-ID: <5728@izar.dcs.exeter.ac.uk>
Source record: 224714

I am about to buy a DTP package for my Atari ST, and I am trying to choose between Timeworks DTP 2 and Pagestream V2.1.

I intend to use the package to produce reports and assignments for my course, and the main feature of the package must be that it produces Postscript files so I can print them on a remote printer.

Pagestream looks the better package (and costs more), so does anybody have any recommendations to make. In particular, what are the hardware requirements to get Pagestream working well? I am running a 1040STe with a hard disk. Will this be enough?

Thanks for your help

Marcus

2452. Crippled GULAM (was Re: gulam -- the best shell)

Newsgroup: comp.sys.atari.st
Date: 1992-03-11 13:48:38 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Mar11144838@orion.laas.fr>
Source record: 224730

```
>>>>> Regarding Re: gulam -- the best shell; ssammy@cs.strath.ac.uk
>>>>> (Paul Sammy 3rd Year iE) adds:

Paul> Thanks for the KEYFIX.TOS info.
Paul> I'll keep it in mind!

You're welcome!

The problems that people seem to have with GULAM is that they might be
running a crippled version. Actually, only an early version seems to
have been delivered with full EMACS-like functionality.

I have received e-mail on this subject from Alexander Lehmann
<alexlehm@iti.informatik.th-darmstadt.de> and Neil Forsyth
<neil@cs.heriot-watt.ac.uk>. Both these people seem to have the
*feature* (I would call it a bug!) that they use ESC for filename
completion.

I am posting this in case others have this same *feature*! This
feature inhibits a lot of GULAM's emacs-like functionality. Normally,
emacs (be it gnu, mg, etc.) ESC functions as a key modifier as does
C-X (control X). Adding the following to your gulam.g file
reestablishes gulams use of ESC as key modifier:

kb -m 15b 71 # allow ESC as meta-key
kb -r 54c 26 # C-X C-L = goto-line

The second line is *not* necessary; it just shows how one can redefine
or add key-bindings.

What does this get you, you might ask? Well first of all TAB becomes
file-name completion in the minibuffer or just under gulam. The new
commands that are possible are defined in the file gulam.hlp, if you
have it. In addition, if you have the following (with your path of
course) also in your gulam.g file:

set gulam_help_file c:\gulam\gulam.hlp

then you get online documentation when you're under `ue' (gulam's
internal emacs). Here are excerpts from the file to show the *new*
commands that become available when ESC is a key modifier (with common
definitons added by me as comments):

gulam.hlp -- help file for Gulam

#1 keycode (in hex) to keyname (rest of line) table
[...]
220 ESC SPC # just-one-space

I think you may have missed the point. You'd be doing it without anybody's *agreement*. You'd be in danger of p*****g off several hundred people all in one go. What would happen then is: we'd take a vote as to whom we would deputise to go round to Allegheny College and smack your knuckles with a ruler.

Watch out for tall dark strangers.

I hace read something about that new floppy controller chip
for TT and Mega STE, but I just wonder if it fits to older
models like Mega ST. Is there any more info about the thing,
and can it be bought from somewhere?

Yes. Of course they'd only exist on your computer. Do yourself
a big favour. Go read the section (on Usenet, they're known as
newgroups) news.announce.newusers. Thats what it's there for.
Helps if you understand what Usenet is, rather than displaying
your ignorance in front of the entire world. (I mean ignorance
in it's original meaning here, lack of knowledge).
If the system you're logged on through does not carry n.a.newusers,
you should ask your admin why.

>Email: wallmann@backus.pu.informatik.th-darmstadt.de
> "Bang that bit that doesn't bang"

OK. I now bring everyone up to date with my current thought processes!

Having recieved a lot of highly positive feedback, both on the net and by
mail, I am definitly inspired to go all out to make this shell a real
winner.

Nat, the shell will not exceed 100k. I promise. In fact, I think it is
a pretty good bet that it wont exceed 50 or 60k.

I made a remarkable discovery yesterday, to do with linking, and organising
libraries. The current 'being developed' version is rapidly approaching
a releasable state, and is 31k. Yes, I said 31k THIRTY ONE K. It is gonna
work with all versions of the O.S. and will run in All resolutions.

Unfortunatley, I cannot really see it being ported to the PC or other
machines such as the Amiga games machine. This is because the small size
is achieved by using some rather sophisticated assembly functions in a custom
library. Totally legal code of course :-).

I love the idea of having the 'shadow' filename completion updated in
realtime behind what the user is typing. I promise to have a go at that,
but I cannot promise to get it done by the first release.
My first idea would be to use the 'ghosted' text such as you get when
a menu option is disabled in GEM.

I have had a rethink about several aspects of it. Some of the suggestions
people made were going to be done anyway, but I didnt want to go into
too much detail in case I got flamed for wasting bandwidth!

Depending upon how large the shell is, I might have 1meg+ versions and
512k versions. But if it stays on target then I dont think it will be
necessary!

Saving history list, and saving aliases was implemeted last night!

The final filename completion code was also coded yesterday, and should be fully done by Thursday night. I have a gig this evening so will be carrying synths about instead of coding :-(. There is a large hint there about why the shell is called what it is!

Many thanks to all who have expressed interest and support.

I would just like to say: its looking good - its actually pretty indispensible in its own development!!!!!

Please continue to write me and tell me what you would like to see.

Edd Deegan
vatec@uk.ac.pcl.sun

PS: A note to Torbjorn.... I just found a little pile of disks today that I had forgotten all about!!!!! I think you know what I am talking about.. Anyway, will be sent tomorrow! Genuine mistake, and apologies!

2459. LAN port

NO.

Read the documentation that came with your system ie the
new users and new users questions. See also news.groups area
for discussion. You may not make the changes with a a call for
votes and recieving a certain number of votes yea/nay.

If you follow the rules, maybe you can make a change.. But would
you follow thru? Naa that would take to much work or effort.

Strange, but it is officially available from Atari France's BBS
(+33)36-15 ATARI. But then again, this is not the first time that
Atari France and Atari US seem to have different policies.

No, you couldn't. Although it is an anarchy, there are people who
regulate the creation of new groups. I think you are supposed to have an
request for discussion and a call for votes. I don't think you would get
enough votes to make a difference, though. The system is fine the way it
is, and the newsgroup is active. In all the time I have been reading the
comp.sys.atari.st groups I have seen only a few MIDI related articles,
and the other two groups you mentioned are covered by comp.sys.atari.st
and comp.sys.atari.st.tech.

No, seems like 12 MHz is the fastest currently in stock. But if you
want more than 19 processors you could always ask the Motorola factory
in France to take up production. 19 seems to be the minimum order :-(

Sorry, by "patches" I meant ones to allow third party 68000 specific software
to work on the 68010, I know current versions of TOS already work with the
68010.

>BTW: Has anybody found a 16Mhz 68010?

Due to the relatively low number of postings to c.s.a.st, this type of division would perhaps be unwarrented. Other groups split when the article per day count goes crazy (like over 100).

I would not have it any other way. Enjoy it while it lasts (I hear AT&T grumblings about "charge by packet" in the future . . .). In many ways, this might be the golden age of connectivity here.

From what I have read the Bj-10e is far to slow, it was so slow they
did not quote the figure, the HP 500 plus or the new colour 500c would
e better to me, but Note: these are only page printers...

From what I have bean told, inkjet printers cost a lot more to run
that Lasers, but it could be cheaper if you refill your own cartridges..

There are going to be a lot more of the Lower end inkjets, I
have read about 3 others, Olivetti was one and the Brother HJ-100 also
the Star SJ-48, these are all the same price as a BJ-10ex in the UK..

So hang around, you might find the one that fits your neads..

> Marcus

I am an 18 year old Atari computer user and I do ALOT of desktop publishing. I am using PageStream 2.1 and to me it is the only way to go!!!!! It is THE DESKTOP PUBLISHING program from the Atari ST as far as I am concerned. However, since it is a newer version, there are MANY more features, consequently requiring at least two megs of memory to be successful, that is to produce many paged docuements. I have a Mega STe with 4 megs of memory. It would be advantageous to get more memory.

That is my spiel.....Hope it is of some value.

-Jason Heideloff
heidelj@alleg.edu

P.S. One reason why I love it is because I can print it to a postscript file and then take my disk and print it out on the NeXT 400 DPI laser printer at school. It is alot of fun!!!!

2478. Atari Developer Kit -- Canada?

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 04:22:36 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <D10HHB1w164w@ersys.edmonton.ab.ca>
Source record: 224726

Hello.

I recently read about an offer from Atari Corporation that stated that the developer's kit was being sold to the public for $150, and also sold in pieces at a lower cost. Is this offer available in Canada, and does anyone know how to reach Atari Canada for information? It would cost less and arrive faster if I purchased the pieces of the developer's kit in Canada, since that is where I live. Any information would be greatly appreciated.

Some friends of mine have a 1040ST, which seems to work perfectly, but they do not have a mouse.

I'd like to know:
1. Can the computer be used without a mouse at all?
2. If not,
a. How much does a replacement mouse (from Atari) cost?
b. Can a surplus IBM type mouse be made to work on the ST?

Please email as well as post.
Thanks in advance.....

2481. DTP advice, for what its worth....

Message-ID: <11MAR92222134@acad3.alaska.edu>
Source record: 224732

Marcus... I've used Pagestream 1.8 and previous versions for several years on a 2.5M ST. When it works, its good enuff. When it locks up For No Apparent Reason (the dread FNAR syndrome) and you have to crash out, wiping an hour's work, you mite consider getting a less capable, but more flightworthy program. Perhaps I have some odd hardware problems (I've asked for comments here before and gotten little response) or perhaps Pagestream's ambition outreaches its code.
If you get lotsa comments, why not summarize to net?

2482. Re: PageStream crashing STe

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 09:02:10 UTC
From: markb@hpwin052.uksr.hp.com
Message-ID: <95630005@hpwin052.uksr.hp.com>
Source record: 224739

I have had about seven responses to my original message, all pointing to memory as the problem.

It appears that at least 2Mb is required as a minimum.

Even machines with 4Mb appear to crash at times.

I have been reliably :-) informed that PageStream has some memory management to reduce the amount of memory used when printing.

If anyone uses PageStream with a hard disk, can you let us know if it is stable. I am now wondering if it is something to do with just using a floppy.

Cheers,
Mark Bridgett

>I can convert these files to a "printable" form on SUN's ? (eg postscript)

I think the following will work:---

Import your picture into 1st word plus and save the file.

Use 1st word to postscript program available at atari.archive. This is
not the most ideal way perhaps but it should work.

Message-ID: <1992Mar12.103954.24304@email.tuwien.ac.at>
Source record: 224733

I have to write some documentation in TEX, and I'd like to know how I can best include graphics in TEX files (both raster/vector graphics). I do have TEX-Draw but I can't get proper results. Which formats do I need (pictex?) and which drawing programs? Also, I'd need a program which saves .IMG files (PD/Shareware). I have also been told that there are some formats for TEX with special commands for drawing tree structures...

Any information appreciated!!

thanks,
Marinos.

Message-ID: <1992Mar12.143304.27972@umbc3.umbc.edu>
Source record: 224736

I also use PageStream 2.1 and agree that its one of the best for the ST. I haven't tried calamus's new version, but I didn't really like the old one, digging through the icons and all.

I have a 520STfm with 4 megs o' Ram, a 84 Meg HD and a SyQuest 44 meg removeable. To give you an idea of how much space you can use, I have about 15-18 megs of clip art and 8 or so megs of fonts... and thats cause I stopped collecting them for a while.

The thing I like about PageStream is that it looks nice on the screen (especially the new version), and I can just print to a Postscript file, take it to school and dump it to a laser printer...

>the Dvorak? I've just started learning Dvorak, and if I get fast enough
>at it to warrant the change-over, I'd like to be able to do so on my ST.

Yes. There's an old program called simply "DVORAK.PRG" that when run will
remap the keyboard for you. I think you can put it in your AUTO folder, but to

tell the truth, I've never tryed.

There are also several keyboard remapping programs around if you can't find
DEVORAK.PRG.

Check with local user groups for the program, or GEnie, BIX, CI$, or whoever.
(I don't have a list of what's in the archives so I can't say if it's there or
not.) The program is quite old, so look pre-1989.

Just checked my archives to see if I had it to UUencode it to you. Sorry,
there's a reference to it, but the disk it's supposed to be on doesn't have it.

(OK, who's been fooling around with my disks!)

The reason I am selling my ST is to upgrade to an STe. I am
trying to get enough money together to buy a 2MB system
minimal. I already sold my second hard drive, and now the
ST and software are going. I am not getting out of the
Atari world. I have supported them too long (and I'm not
complaining).

2495. Atari Monitor, SW for sale

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 16:29:40 UTC
From: houlton@CS.ColoState.EDU
Message-ID: <1992Mar12.162940.39915@yuma.acns.colostate.edu>
Source record: 224741
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I've still got the following pieces of my Mega2 system for sale:

Hardware price
-------- -------
Atari SC1224 Color Monitor $125

Falcon, KingsQuest3,
Revolver, PCDitto,
Flash Telecomm,
assorted other SW $50

Everything has original boxes, manuals.

Email to: houlton@cs.colostate.edu

2496. Re: Crippled GULAM (was Re: gulam -- the best shell)

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 16:31:25 UTC
From: vj@gserv1.dl.ac.uk
Message-ID: <VJ.92Mar12163125@dlsi.dl.ac.uk>
Source record: 224863

In <RALPH.92Mar11144838@orion.laas.fr>, Ralph P. Sobek describes how to re-establish gulams use of the ESC key as the 'meta' key modifier. Does anyone know if it is possible for gulam to use the alt key as a meta key ? I am accustomed to having a real meta key when using GNU EMACS on a sun, and it would be nice to have this on my ST as well.

Source record: 224742

Well.. about PageStream's reliabilty, lets put it this way. Save often. When you do a big change to a document, save it. I will go a long time without crashes but the program seems to know when I have made a nice document and haven't saved it. It waits till I'm doing the finishing touches and BOMB!

It is fairly reliable off of HD.. I couldn't imagine running it from floppy.. Phew.. :)

hmm, I admit I thought it was because csh uses ESC for completion...

> I am posting this in case others have this same *feature*! This
> feature inhibits a lot of GULAM's emacs-like functionality. Normally,
> emacs (be it gnu, mg, etc.) ESC functions as a key modifier as does
> C-X (control X).

Great!!
I always thought that this was because the ue was a "baby"emacs.

> Adding the following to your gulam.g file
> reestablishes gulams use of ESC as key modifier:

> kb -m 15b 71 # allow ESC as meta-key
> kb -r 54c 26 # C-X C-L = goto-line

> The second line is *not* necessary; it just shows how one can redefine
> or add key-bindings.

erm, whats the switchs for?
-m == modify keymap yeah?

whats -r mean?
And how do I determine which control sequence equals what code?

[gratefully received help deleted for brevity]

> Hope that someone finds all this useful!

Most certainly.

What is the most upto date version of gulam? Or better yet, where can
I get the latest version by ftp?

regards Paul

2501. Dvorak

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 17:53:25 UTC
From: glenn@ludwig.sharebase.com
Message-ID: <9203121753.AA22581@ludwig.sharebase.com>
Source record: 224745

I have written such a utility. I'd be glad to EMail it to you, or anyone else that is interested. Works fine from AUTO folder. Implements the ISO standard Dvorak keyboard, except for the key that is missing to the left of the QWERTY Z. Mostly, this means that the shifted] is [, and the shifted } is {. Many people don't do this, because they can't then rearrange the QWERTY keycaps to the Dvorak positions. I don't bother rearranging keycaps, because QWERTY only people use my computer also. Also, by not rearranging the keycaps, I am forced to do touch typing without cheating, which is faster in the long run than looking at the keys.

Yes, it is possible. I do it all the time. The way that I do it is I
call a local host and just simply download it. Atari disk drives are
capable of reading MS-DOS disks, however, the TOS in the Atari must be 1.4
or greater.

Yes, it would almost be senseless to use PageStream without a HD. It is very fast. About the memory, I don't believe that is why it crashes. I think that every once in a while, someone will do something out of the ordinary and it doesn't expect it and then crashes. Plus, if you don't save on a periodic basis anyway you are always taking your chances of losing your information.

2508. MultiTeX 5.0

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 21:48:57 UTC
From: lahtinen@gideon.gideon.fmi.fi
Message-ID: <lahtinen.700436937@gideon>
Source record: 224862

I just got a new ST Computer magazine and there was a small notice
that CS TeX has a new version called MultiTeX and it is almoust
commercial. It means that it is available as a Sonder Disk and
the price is DM 75,-. The "Multi" part comes from MultiGEM, the
TeX system is now fully compatible with MultiGEM, you can edit
one file "compile" other and print a third one at the same time.
Also there is a separate version for TT that understands the 882.
Perhaps it also works with SST also.

I think CS TeX has been a nice program, and well worth some
money. But those MAxon Sonder Disks are not so good idea.
They do not accept credit cards. I would have liked shareware
idea more. Or if some English or US company could arrange
with the author that those disks could be ordered with a
credit card.

2509. Re: ST mouse

Newsgroup: comp.sys.atari.st
Date: 1992-03-12 22:20:13 UTC
From: Michael Paul Greelish <mg20+@andrew.cmu.edu>
Message-ID: <EdjxYRm00VB7AIIUx5@andrew.cmu.edu>
Source record: 224853

Charles Hobbs says:

"Some friends of mine have a 1040ST, which seems to work perfectly, but they do not have a mouse.

I'd like to know:
1. Can the computer be used without a mouse at all?"

Yes, but it's a royal pain. You can use the "Alt" key, the Shift key, and the arrow keys to move the pointer/cursor in most GEM-based ST programs (it's a standard GEM feature, check the ST manual.) This won't work, however, with a lot of non-GEM programs, like games and paint programs. I suggest you buy a mouse.

"2. If not,
a. How much does a replacement mouse (from Atari) cost?"

Call up Atari and ask if you like. It'll probably be around $35-40, as last time I checked they charged $25 just to replace a busted mouse. But Atari mice suck anyway, they're un-ergonomic and break a lot. I went through two before I switched to a Jin/Golden Image mouse two years ago, and I haven't had trouble since. It cost me $35 from J&R Music World in New York, back when they still sold Atari products. Nowadays, I'd suggest getting a catalog from a remaining Atari dealer (like E. Arthur Brown) and shopping for mice. E. Arthur is offering this neato-looking one called a Beetle mouse for a decent price, and there are lots of other 3rd-party mice out there.

"b. Can a surplus IBM type mouse be made to work on the ST?"

Yes, but the modifications aren't for the techno-illiterate. If you have an IBM mouse laying about, you might want to try this, but don't go and buy one and then try to modify it. IBM mice are more expensive than ST ones (in general), and like I said, the modification is a bit of a pain if you're a software-only guy like me.

Hope this helps.

Why do you say that you need 1.4 TOS or greater? I embarrassingly admit
that I still have 1.0 but I can read DOS disks fine all the time. In fact,
I also can format the disks on a Sun SPARC station and use mtools to store
files or use a IBM RISC/6000 and use mtools to store files without ANY
problems.
Do I have a weird version of TOS or what?

Actually, I guesss I did sort of make a mistake. I guess you probably can read MS-DOS disks on versions of tos below 1.4 however in order to format disks in MS-DOS format, you must have 1.4 or higher.

The news I have put together over the past several months seems to point
to the fact that this new ST will have better graphics and sound.

In fact, it maybe compatible with the Jaguar (Atari's newest home video game
system).

I hacked mine to run off my hard drive, but that was a while ago. I don't remember what needed to be changed just to get the drivespec different. You might consider just booting the game off your B drive - have you tried that?

Cross-posted to: comp.sys.atari.st,misc.forsale.computers

FOR SALE:

Atari ST 49 Meg SCSI Hard Disk

FEATURES:
- 3 1/2 49 Meg SCSI Drive
- External Shoebox type with room for another 1/2 ht Hard Disk
- Includes cables for adding another drive
- Has Cooling Fan, Power supply
- ICD host adaptor card
- Ave access time 40ms.
- Extra DMA port in the box for chaining DMA devices.

Ave usage of 1-5 hrs per week for 2 yrs. Includes Manuals, HD software.

Reason for selling: Need money for PC system.

Price: $325 or BEST OFFER, I pay UPS COD Shipping.

Email Reply to:

2520. Summary: Request for comments

Newsgroup: comp.sys.atari.st
Date: 1992-03-13 05:35:01 UTC
From: CLARK@SALK-SC2.SDSC.EDU
Message-ID: <9203130532.AA12017@ucbvax.Berkeley.EDU>
Source record: 224865

(This message posted to comp-sys-atari-st@ucbvax.berkeley.edu)

My original message:

/ I read the info-atari16 digests of the usenet discussion of Atari
/ST computers. Over the past few months I have posted a couple of questions
/to "Info-Atari16@naucse.cse.nau.edu" and have gotten ZERO responses, even
/though my messages appeared in the digest. Right now I'm wondering if these
/email posts ever make it through to the usenet side, so I'd really
/appreciate it if a few people who see this message through USENET can drop
/me a line to let me know.
/
/ Thanks in advance for your help.
/
/
/Steve
/
/clark@salk-sc2.sdsc.edu (Internet)
/clark@salk (Bitnet)

mfitz@tecnet1.jcte.jcs.mil (Mike Fitz) reponds:

/I too have posted stuff to the digest from the Internet side of things; and
/like you I just see my post just whiz by in the digest unanswered and
/uncommented upon. I got a little angry with this and queried the "moderator"
/(he's somewhere outside boston, I understand) about the status of
/cross-posting. (The preliminary stuff at the start of each digest
/says something like "cross-posting to Usenet is getting closer,
/but keeps geting trashed out"). The "moderator" wrote back, telling
/me that he was in Boston, and the digest computer was in Colorado,
/and that this computer (a PDP-11/twentysomething, I guess) was the
/only host he could find, and that there were really no efforts to
/get Internet inputs to the digest cross-posted to Usenet. So
/anyway, if you complain to him, he willask you if you know of a
/better host or a cross-posting program for the computer in Colorado.
/...So that's the scoop. If you want cross posting, either find this
/guy a better machine or find yourself a news feed.

hohmuth@freia.inf.tu-dresden.de (Michael Hohmuth) responds:

/I had exactly the same problem which i sent to info-atari16-request.
/They answered that arcticles posted to info-atari16@... are not cross-posted
/to the usenet because of some problems (mail loops...).
/
/For now, you can post stuff to comp-sys-atari-st@ucbvax.berkeley.edu
/(i think; ask at info-atari16-request@... for assurance).

/Articles sent there will show up in the usenet two days later or so.

John Dunning at info-atari16-request@... confirms that messages
posted to comp-sys-atari-st@ucbvax.berkeley.edu will make it to
comp.sys.atari.st, but this method is not highly recommended (the people
at Berkeley don't like it).

Hope this information helps out some other digest readers. Maybe
you usenet guys can propose a better solution?

Steve

The STe has a built in clock, but without built in supply (i-e you have to initialize it at each power on). Some hard disks can do that for you ...

You can use a SC1224 monitor with an STe ATARI without any problem ...

To get the TOS 2.06, you can buy it from atari, or read the news to see if someone wants to sell his TOS. But surely, TOS 2.06 is better than the TOS STe (TOS 1.6).

Bye
Karim

From: harryk@csa.bu.edu
Message-ID: <99700@bu.edu.bu.edu>
Source record: 224651

I just put "atz234d.zoo" on atari.archive.umich.edu, and it should be available to the public real soon now... For those who don't have ftp access I'll also send it to comp.binaries.atari.st.

ATZ234D.ZOO is a demo version of Atzenta 2.34, the complete personal information manager for the ST. The demo version does not allow saving but comes with sample data and memo (for the built-in calendar) files. The ASCII version of the 45 page manual is included in the package so interested people can read all features of the program.

BTW, could someone please send me infomation about applying for the ST Developer's KIT? I know it's been asked before, but I didn't pay attention then... I'm interested in any address or phone number I might need in order to get more info...

thanks

Sounds terrific ! Is it any faster now (the main TeX part I mean)

>
> I think CS TeX has been a nice program, and well worth some
> money. But those MAxon Sonder Disks are not so good idea.
> They do not accept credit cards. I would have liked shareware

I recall thtat the previous version(s) of CS TeX were available for ftp, so I think this version will be too, as the previous versions were also distributed on MAXON SonderDisks.
If someone knows if it is already on any (german ??) ftp site, please make this public to the group, or if s.o. has got the sonderdisks please upload them to a public ftp site.

Thanks !

Message-ID: <1992Mar13.130219.23671@unibi.uni-bielefeld.de>
Source record: 224873

Hi there outside!

I was asked to post it if there were any news about the possibility to connect the Vortex ATonce 386-SX emulator to one of the VGA graphic cards now being available for the Mega STe. I`ve asked them. The answer is simple:

No.

I was told that on the one hand side it would be more complicated than I thought and on the other side they think none of the existing cards is spread wide enough to make it worthwile to sit down and do this work now. They claimed that there are not enough people interested in it as far as they regarded their requests. So if YOU would like to have the emulator to work with a VGA card, write to

vortex Computersysteme GmbH
Falterstrasse 51-53
D-W7101 Flein b. Heilbronn

phone : Germany 07131/59720
fax : " 07131/55063

To make it totally clear to everybody: I don't sell this stuff, I just happen to own one and am interested in as much information about it as possible. So please don't ask me for further details on THIS topic.

>have read about 3 others, Olivetti was one and the Brother HJ-100 also
>the Star SJ-48, these are all the same price as a BJ-10ex in the UK..

I've had a Canon BJ10-ex for about 4 months and I've got no complaints. I've printed one 40 page report on it (twice actually - in draft and full quality, which uses 2x as much ink) and about 100 other pages of DTP output (all at full quality). By 1st ink cart. shows no sign of running out yet...

As for it being slow - I just dont know where this came from (well, I know it was from some magazine review). A full A4 page of Calamus 10pt Swiss text in full resolution (360x360) on my 2.5MB 1040STF prints in about 1 min. The printer is not the limiting speed factor - Calamus pauses for recalculation whilst the printer goes at full speed (the carriage speed is pretty much the same as my old Epson FX-80 dot matrix). What I would like is a BJ10 GDOS driver (or is there one in FSMGDOS?) cos I'm stuck with an LQ-800 driver at the moment which only does 180x180 resolution :-(

It should be noted that the Brother and Star (and Apple StyleWrite?) both use the same Cannon mechanism so the print speed is unlikely to differ. Pricing? Well, I got mine from a mail order warehouse for a total of 350 pounds (inc VAT + sheet feeder and extra ink cart) which is about the going rate.

Hope thats of interest.

e>As for the many contradictory rumors floating around about multitasking
e>TOS; suffice it to say that wild speculation about unreleased products
e>is rarely productive (and even more rarely accurate :-).
e>Let's wait and see what Atari actually produces, shall we?

Well, just yesterday at the CeBit fair I could see what Atari actually
produces:
There was a demonstration show of the comming MultiTOS, and it really _is_
based on MiNT! They said that it will come out as a ROM-Upgrade, available for
all Atari Computers down to the 1040 ST, although it won't be very usefull on
a maschine with less then 16mhz. They were not able to give any exact
information about the release date, but they said that it will not be before
the Atari fair in Duesseldorf (Germany) in august.

2534. 520ST for sale

Newsgroup: comp.sys.atari.st
Date: 1992-03-13 14:01:39 UTC
From: ameyer@seqp4.sequoia.com
Message-ID: <1163@seqp4.sequoia.com>
Source record: 224874

School is over, and I find that I now have far more
powerful computers available to me than anything I
am likely to get from Atari. As a result, it is
time to sell my trusty old Atari ST.

Hardware
----

* 520 ST (circa 1986)

- TOS in ROM
- 1 Meg Memory expandable to 4 Megs
(E.A. Brown Expansion board)
- mouse & pad
- Midi ports
- parallel & serial ports
- RF Modulator for TV hookup

* SH204 20 Mbyte Hard Drive

* SM124 Monochrome monitor

* SM314 external double sided floppy drive

* Avatex 1200/300 baud modem

* Spectre 128 Macintosh Emulator Cartridge
(MAC ROMs not included, note this is not the GRC)

Software
----

* Personal Pascal

* Laser C with source debugger

* Word Perfect

* Flash terminal software

* Kermit

* Lots of other stuff including:

flight simulator II
Omni-Res
thunder
1st Word
easy draw

Lots of PD software

Everything is in perfect working order. All documentation and original discs are included. This system has been meticulously maintained.

I'm selling it since I really don't use it much anymore. When I do need to run a program at home ...sigh... it has to be on a PC compatible.

I am looking for offers around $800. I will pay shipping and insurance.

For information or offers, contact me at:

ameyer@sequoia.com

>
> I'd like to know:
> 1. Can the computer be used without a mouse at all?

yep, either:

(a) use the ALT-cursor key combinations (shift slows it down I believe).
ie shift up-arrow moves the pointer upwards.

(2) avoid the desktop and use a shell, ie have an autoloading gulam or
something.

I would suggest that since your friend doesn't know about the ALT-arrow
combination that (2) is not the best option, and he/she should buy a
new mouse.

> 2. If not,
> a. How much does a replacement mouse (from Atari) cost?

I don't know the price in $s.
It would probably be best *not* to buy an atari one anyway- get a third party
one- they are generally thought to be better. Last time I looked it was about
30 pounds for a mouse here in the UK. Due to a longstanding tradition (ie
the stateside stuff being cheaper) it'll likely cost about $30 or less.

> b. Can a surplus IBM type mouse be made to work on the ST?

I dunno. I doubt if the standard microsoft one will work- but since the PC would
is so non-standard...

> Please email as well as post.
> Thanks in advance.....

Hy,
Anybody has some experience with the GLIB generic librarian synthesizers
editor PD ??
Anybody can tell me what is the *best* (if any) C compiler for the STE ?
Best means the more standard one !! (if any again !)

Thanks for the Help

Ciao

|>
Well not really, maybe to make DOS readable disks with TOS you need TOS 1.4
however you can have a run of the mill TOS 1.0 and use a program that writes
an IBM directory to the disk. There is a variety of such programs on a.a in
fact I have a PD accesory that does it.

I agree... with the Midi also. I think that it would help draw together the midi crowd a little more, especially since Midi is a big application of the St.

>From what I have bean told, inkjet printers cost a lot more to run
>that Lasers, but it could be cheaper if you refill your own cartridges..

From experience with a Hewlett Packard DeskJet 500, I find that it's a cheaper than a laser to run. New cartridges can he had for about 15 quid in the UK, and they do seem to last for the advertised 500 pages. You'll need to add the cost of good quality photocopier paper too, but you'd still have to add that for a laser too.

The best thing about inkjets is that you don't have to replace a corona wire and/or drum. In short, I love my DJ 500!

Source record: 224879

I've looked at the use I get from my Mega, and the prices of TTs and decided the way to go for now is to get one of the speed-up boards.

The options seem to be the 20 or 25 mz fast 68000 board from Jim Allen or switching to one of the 68030 boards from either Allen or Gadgets, the latter two obviously being a bit more expensive.

The question is, in real everyday use (mostly Pagestream and TeX), how much speed up would I really see? If the fast 68000 really speeds up recalculations in Pagestream (and particularly the final Creating Page phase), by a factor of 2 or 3, that's enough for me for now. Has anyone had experience with this upgrade yet?

The entry-level 68030 upgrade from Dave Small doesn't look very expensive either... how much speedup should I expect from applications like Pagestream with it? (And will old favorites like Flash and Gulam still work with it?)

I've seen partial reviews or earlier versions of these boards in various ST magazines, but nothing "definitive".

Thanks for any help.

Message-ID: <QdkDLea00VAuECEEwF@andrew.cmu.edu>
Source record: 224884

I have an Epson LX-90 printer I'd like to sell. I'm upgrading to an HP Deskjet 500, and a new computer when money permits.

Specs:

Epson LX-90 9-pin dot matrix printer, vintage 1985.
Treated gently, works perfectly.
Tractor feed or single sheet.
100 cps draft, 40 cps Near Letter Quality (2-pass, ok-looking serif type.)
Double-strike, emphasized (bold), compressed, expanded, super/subscript,
12 CPI Elite alternate font, underlining, foreign characters & more.
Graphics mode up to 240x72 dpi.

"IBM parallel" standard interface. Plug and play with an ST/Ste or PC.
Other interface cards (Centronics, etc.) available from Epson, if you
need them.

I'm asking $115 including shipping. This includes a barely used ribbon
and a spare. Ribbons for this thing last forever (6 months of heavy use
is typical) and cost about $3.50 discount.

Please email me at the address in my .sig if interested.

Who needs postscript? I do. Alot of people do. I have calamus and its good
for some things, but with PageStream you can dump a file to a postscript
file, take it to a laser (if you don't have one) and dump it to the laser.

For instance, I have a dot matrix and ink jet at home. I use the dot matrix
for drafting out what I want to print, then, once I'm happy with it, I
print it to a Postscript file and take it to school and print it in the mac II
lab.

Not everyone will use postscript, but it is a very nice feature, and you will
get very nice output from it..

I paid for a subscription to Start magazne last May and the only way I know Antic got my order was their cashing my check. Phone calls to the offices and letters have gone unanswered. And I read here that Antic has disbanded only to reform as a NEW company that will not honor any of the debts or obligations. I didn't think that was legal here in the U.S.. Does anyone know the real story? If there is a new Antic does anyone have phone numbers, Snail Mail address, and better yet Email address? I would like names of people to contact to get a refund or something for my $60.00. Post it all here to the net, I'll bet there are others like myself feeling ripped off and not knowing what to do next.

>
>It should be noted that the Brother and Star (and Apple StyleWrite?) both
>use the same Cannon mechanism so the print speed is unlikely to differ.

The Apple Stylewriter is absolutely, unbelievably slow! I'm talking I've seen it take 12 minutes to print a page at 360dpi. also note that it is not a true 360 dpi printer, it is 180*180 doubled, just like a 24pin dot matrix, so greys will be much worse than a true 300 dpi printer. All the output I've ever seen from the HP deskjet 500 is FAR superior to Stylewriter output, as well as far faster. Also, I've never heard from anyone who was dissapointed with their HP printer, while I've heard lots of complaints about the StyleWriter. It is possible that the Cannon Bubblejet is an improvement over the StyleWriter, but from what I've heard (and as was stated above), they are the exact same printer in a different box. Also, when running the head over the page twice, it does not always line up correctly, just like a double strike on a dot matrix. Really, the HP deskjet is a nice piece of machinery and the StyleWriter just strikes me as a toy. The Bubblejet and StyleWriter do have attractive pricing though... Trust me, I've never in my life seen a printer so slow as the StyleWriter, and I've used a lot of printers...

The Trenton Computer Festival 1992 will be held at Mercer College on
Saturday, April 11 (9-6) and Sunday, April 12 (10-4).

This year's festival features:
- The world's largest outdoor personal computer FLEA MARKET
- Over 170 National Vendor and Commercial Booths, featuring AST,
Adobe, Aldus, Borland, Microsoft, Lotus, Corel, Micrografx,
Toshiba, Hewlett-Packard, WordPerfect, Intel, Symantec,
Software Publishing, and local vendors.
- More than 125 FREE Seminars, Forums and Talks on all aspects of
computing.
- Thousands of dollars worth of door prizes, including an AST 386SX
notebook computer, an HP color printer and an HP color scanner.
- Saturday evening banquet features keynote speaker, Paul Grayson,
CEO of Micrografx. Tickets are $20 each.
- Admission:
General: $7 for both days; $5 for Sunday only
Students and Seniors: $3 for both days
Preschoolers accompanied by adult: FREE
Other Children Under 12 accompanied by adult: $3 for both days,
FREE on Sunday only

Files with all kinds of good information are available for anonymous
ftp from pilot.njin.net (128.6.7.38) in pub/TCF/tcf. They include:

what.is.TCF - history and description of TCF
gen.info - general info about TCF, directions, parking, etc.

1992 TRENTON COMPUTER FESTIVAL

TCF needs lots of volunteers to be a success. This year, volunteers are eligible for special prizes in their own drawing!

By volunteering four hours of your time, you will also receive a free two-day ticket to this year's annual Trenton Computer Festival, April 11-12, at MCCC, a colorful cap and a free lunch ticket.

Volunteers work in several areas, as needed by the organizers. Some of these are (1) helping Security to direct traffic, (2) helping speakers and people attending talks, (3) providing general information to attendees, (4) selling tickets, (5) helping in the flea market area, (6) helping in the vendor areas, (7) checking for tickets at the doors, and so on.

Thank you for volunteering. Have fun!!

I. Personal information:

NAME:_____

HOME (Evening) TELEPHONE:_____

WORK (Day) TELEPHONE:_____

II. Please make three choices from the list below:

SAT:6-10 SAT:10-2 SAT:2-6 SUN:8-12 SUN:12-4

First choice:

Second choice:

Third choice:

Return the completed form as soon as possible but no later that April 1, 1992. You will receive a telephone call from the coordinator of volunteers telling you when to report. Go directly to the lobby of the Theater Building on the MCCC campus to get your tickets, cap, etc. and your assignment.

Thanks a lot for helping!

Pete Holsberg
Steering Committee

Hi there. My apologies if this is completely the wrong place for this. If it is, perhaps some kind soul could direct me accordingly.

I am looking for a MIDI file (I use Notator 2.2 so compatable formats are acceptable too). The song I'm looking for is "Jesu Joy of Man's Desiring". The tune is "The Chorale from Cantata #147" by J.S.Bach.

If anyone has this or knows where I could find it, I'd like to hear from you.

Thanks in advance
Kevin Thorpe

On the source side (the Sun, I assume) try running kermit with the -i
option. Only do this for executables and other binary files, not with text
files. Your shouldn't have to uuencode files.

Hope this helps.

Does anyone have a good source for buying flyback transformers & triplers?

I am repairing a monitor which has a slightly melted flyback and needs a replacement. It is an Atari ST color monitor SC1224 which was made by Goldstar. I tried one source, Electronix Corp., but they could only supply parts if the original Goldstar Part number was known. Since this is an OEM item the numbers are different.

The numbers on the PART is KF4825G
60 2M
made in japan

It has 10 pins and I don't know the manufacturer. The symbol on it is at follows:

--
Walt Hoffman -- Jet Propulsion Laboratory
whoffman@jato.jpl.nasa.gov or elroy!jato!whoffman@csvax.caltech.edu
Galileo Orbiter Engineering Team -- Real-Time Analyst

Second thoughts, the STE 520 with one meg of ram here is called a STE
520 Plus, that is all that they bring here or did...

One shop here is selling STE 520 for some $250 us, they are getting
out of Ataries..

|I agree... with the Midi also. I think that it would help draw together the
|midi crowd a little more, especially since Midi is a big application
|of the St.

The ST is not the only machine that runs MIDI software. I suggest you guys take a look at newsgroups like rec.music.synth; we don't need yang (yet another news group). This is from grepping of 'music' in my .newsrc: comp.music, rec.music.makers, rec.music.misc, rec.music.synth, rec.music.beatles, rec.music.classical, rec.music.folk, rec.music.gaffa, rec.music.gdead, rec.music.cd, rec.music.dementia.

If you don't get such newsgroup, talk to your system administrator.
Cheers,

Leo.

Pinhead is a very stable application, so I would assume it has something to
do with something executing before Pinhead (or the thing which executes right
after it). I have pinhead as the second auto folder program (the first is
fatspeed), and have never had a problem. I would put it early in the boot
sequence (it would be useless to put it near the end), and see what happens.
It is possible that the program right after Pinhead is depending on clean
memory, in which case you can tell pinhead to leave it alone (there is a
config file facility).

>1. Can the computer be used without a mouse at all?

Yes, but painfully. If you hold down <alt>, then the arrow keys will move the mouse pointer. The <insert> and <clr home> keys act as the mouse buttons. I think if you hold <shift><alt> the mouse pointer moves at a much finer increment (usefull for drawing programs and such). You need a mouse.

>2. If not,
> a. How much does a replacement mouse (from Atari) cost?
> b. Can a surplus IBM type mouse be made to work on the ST?

a. They can be gotten for $30-$50 via mail order. Give Toad computers a try (1-800-448-TOAD). I recommend the Beetle mouse, or the new model Atari mouse (round rotating mouse door on the bottom, be sure to specify this!!).
b. If it is a bus mouse, yes. If it is a serial mouse, no (unless you can hack it into a bus mouse). Instructions are available if you need them.

I would call it a feature, as it emulates the good 'ol csh. I have been
using csh (with the filec option set) for years, and I was very pleased to
find that Gulam supports this. I do see how this would be annoying to a
ue user (I am a vi guy myself, so I use STevie which interprets the [esc]
key just fine), but one could always use GNU emacs or MicroEmacs (and I
think there are a few more).

>call a local host and just simply download it. Atari disk drives are
>capable of reading MS-DOS disks, however, the TOS in the Atari must be 1.4
>or greater.
>

This is not 100% accurate. ALL versions of TOS will read/write to PC formatted disks just fine. However, TOS 1.0 and 1.2 will not format disks from the desktop that can be read by a PC (due to missing bootsector information). The solution is to use one of the PD formatting utilites to format these disks (like ps2form or ibmfmt from atari.archive). Alternetely, many other applications which support formatting already do this (Neodesk and Universal Item Selector III, for example). One can also upgrade TOS (the version of TOS can be acertained by looking at the DESK dropdown on the desktop).

Note that many PC drives are now of the HD flavor. To correctly format a 720k disk in DOS (which will try to format HD no matter what the drive tells it), use "format a/b: /t:80 /n:9". This disk will be fully usable on the ST.

Many ST users use the "twisted" disk formats on the ST. These will read/write twice as fast as the standard TOS (and DOS) formats. I only use the slower format when I need PC compatibility. Again, most PD/commercial utilities will format in Twisted mode nowadays (the above examples included).

This only applies to the built-in formatting function in the desktop.

2571. MultiTOS really exists - thanks to Eric S.

Newsgroup: comp.sys.atari.st
Date: 1992-03-14 15:41:13 UTC
From: univwa@sbusol.rz.uni-sb.de
Message-ID: <17037@sbsvax.cs.uni-sb.de>
Source record: 224659

Yesterday I visited the Hannover Cebit fair - and they really could show it:

The MultiTOS !!!

It exists - and it runs!!!

They had a beta version, but what I could see:

Atari now has a OS like the Mac, it does Multitasking in several windows,
not a task switching like the Mickey Mouse commander on a MS-DOS machine (brr,
I'll have to wash my mouth afterwards...).

The Multitos runs at the moment as a program, but it will be distributed in
ROMs. The Atari guy I spoke had to avoid that it bases on Eric Smith's work,
they only added the GEM surface. He said that the development now will be
continued on Atari side and will surely make another way than Eric's MiNT.

That's all for now...

Bernhard

No, the previous versions have been published on public domain disks.
"Sonderdisks" contain software (c) Maxon. Multitex 5.0 is neither
PD, nor freeware, nor shareware. It's a (rather cheap,) commercial
product.

While everyone is discussing Pagestream, I have a question:
Can Pagestream save to *Encapsulated* PostScript?
I would like to use it as a capable drawing program to generate
PostScript drawings for inclusion into LaTeX documents. I currently
use Easydraw and mfps.ttp with a bunch of metafile "filter" programs
that I wrote to fix all the Easydraw & mfps bugs. I'd rather use a
cleaner system & I would also like a more powerful drawing interface
than Easydraw's.

Please note: I am not interested in anything other than LaTeX for
document processing nor am I interested in drawing/printing formats
other than PostScript.

Thanks,
Scott Willingham // willing@icsl.ucla.edu

Antic has indeed folded, leaving lots of people angry. James Capparell is now publishing PC Home Journal. Antic, as a company, no longer exists. From my understanding, the SF DA's office looked into some complaints from Antic subscribers but gave up because Capparell claims PC Home Journal is a totaly separate company (even though Antic was publishing that magazine at first).

What it boils down to is that lots of people got stiffed. Sad.
It even had an impact on the rest of us producing Atari publications in the US.

Bill Rayl/Atari Interface

2578. Multitasking TOS on CeBit

Newsgroup: comp.sys.atari.st
Date: 1992-03-14 20:55:42 UTC
From: techno@lime.in-berlin.de
Message-ID: <W8B174@lime.in-berlin.de>
Source record: 224660

Atari demonstrated the new multitasking TOS on the german CeBit computer
fair. Due to the huge crowds, I was only able to cast a glimpse at it,
though it seemed to run OK.

Message-ID: <CJP.92Mar14222452@csrrgrsc.aber.ac.uk>
Source record: 224671

I just picked up the new ST Format at my local newsagent (I gave up getting any of these rags by subscription years ago - not enough new features to go round).

It cost a quid more than usual, but came with an extra disk, containing a full copy of WriteNOW (still retailing at 45 quid). I assume that STFormat did some deal with the people who make it, giving them 30,000 quid or so for the rights to distribute it, and still making a profit on the deal.

Anyway, if you want a good wordprocessor for next to nothing, act now!

I gues this should have a UK distribution, but I thought the rest of you wqould be interested in what you are missing.

That is their second good offer this year - January's issue came with a full copy of Sequencer One and of Canvas. If they keep this up, I might take out a subscription to make sure I don't miss any more good software.

Do either of these 2 do frames in other directions that just straight
normal... e.g. sideways, upside down etc.

And do any others???

Craig.

From: twright@umaxc.weeg.uiowa.edu
Message-ID: <11576@ns-mx.uiowa.edu>
Source record: 224601

I just got a copy of MGR, but everytime I try to open a Window it says 'can't open pty'. I have MiNT running, it seems to work okay. I only have 1M of RAM, though. Am I running out of RAM or do I just have MGR set up incorrectly?

Another question. Seems like every program I FTP has docs in .TEX format? How can I translate these into something comprehensible by humans? I don't have GDOS, nor want it, BTW.

2583. Help - 1040ST memory upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-03-15 08:57:57 UTC
From: ladasky@netcom.com
Message-ID: <016h2smladasky@netcom.com>
Source record: 224669
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

O.K., I finally got enough desk accessories and needed a large
enough RAM disk so that I'm starting to get "out of memory" errors from
my 1.0 Meg 1040ST. I went down to my local retailer and asked about
upgrading to 2.0 Meg. He said I would need a $139 upgrade board, *AND*
that the memory on the motherboard would be invalidated by the addition
of the piggyback board - so I would need 2 SIMMs at $50 each.

Does this seem right? Isn't there a cheaper way?

2584. Signum > PC formats?

Newsgroup: comp.sys.atari.st
Date: 1992-03-15 10:35:57 UTC
From: majnun@parrot.in-berlin.de
Message-ID: <PUC1VEX@parrot.in-berlin.de>
Source record: 224675

Hi,
I'm not sure whether I am posting this to the right group, but I/ll try anyway.
I am a Macintosh user who wants to import a bunch of files created with Signum on an Atari to read them with MS Word.
I can, of course, save the Signum files as plain ASCII text, write them to a DOS floppy, insert that into my Mac, and open it with MS Word. But in that case, all the formatting done in Signum is lost, of course.

The question is: is there any possibility to convert formatted Signum files (text, no graphics) into a format that can be understood by whatever other application on a DOS-PC or a Macintosh? DOS compatibility would help, because there are plenty of filters for all kinds of exchanges between DOS and Mac computers.

Any help would be greatly appreciated. If this question should rather be asked in a different group, please tell me.

And please respond by e-mail, since I am not reading this group. I am perfectly willing to summarize any answers I get to the net.

Thanks a lot
Albrecht Hofneinz
majnun@parrot.in-berlin.de

2585. Re: MiNT's copyright status (was: MiNT and MTOS)

That Big MMU chip now has the Blitter fitted to it, the newer STE's
now have blank pads to were the old blitter was..

I don't think you will ever find out, unless Atari has released the details..

I do 2.5 meg memory upgrades for people here, I do not use any Plug in upgrades,
to me they are all rubish, I use SIMM soldered and mounted to the main PCB,
I only charge $350nz for this, the Atari dealers here charge $350nz
for just a 1/2 meg upgrade..

SIMM's cost about the same here..

h>WINXnnn.PRG only runs on ST's/MegaST's with German TOS 1.04! It supplies the
h>AES with more workspace for windows (up to 127 windows).....

And the author is working on a new version, which is supposed to work with every(?) TOS Version. It'll need support by another program that copies the GEM into RAM (like ROMRAM, etc. or the GEMRAM program which is also from the author of WINX and shall be available together with the new version of WINX).

As far as I heard about it, the new version is on the way to get finished, but the author didn't give any "shipping" date yet.

So we have to wait a little longer.

> Patrick
>
>
Then you must be running it on a hard disk! Timeworks senses the
drive letter it was run from and modifies its behaviour
accordingly. To print PS files to disk with a floppy system you
need two things:

1) A ramdisk (Maxidisk is ideal because it also compresses data)
2) A lot of memory as the ramdisk needs to be 700k or so.

Now when you run your system you transfer all your Timeworks
boot-disk stuff to the ramdisk and run it from there. When you
need to save you should find that the print-to-disk option is
available. Select a floppy to save it to and off you go.

I have got an old SM124 monochrome monitor (Goldstar) that has a BIG problem: If there is any amount of white space on the screen, the sides begin to shrink, and if too much white appears (or just turn up the brightness to a useable level...) the damn thing looses the horizontal sync.
Does anyone have any previous expirence with THIS problem? (
I have checked the obvious loose joints, etc.) I miss my ST dearly, and would at least try to fix before buying..

Thanks!
Tony.

PageStream can import EPS files and use them in docuements, but then the document must obviously be printed through Postscript. I use Calamus Outline Art and the import the EPS files and then print on a NeXT 400 DPI printer. It works very well.

> Do I have a weird version of TOS or what?

Nope, you just can't format them on your ST without the aid of a program
made to di it... with TOS greater than 1.4(?) you can just format them
from the desktop.

The only difference is the first 2 bytes on the disc, the IBM uses them
to tell how the disc has been formatted, TOS 1.4 & greater puts that
info there for use in a MS-DOS machine, otherwise you just use a format
program that does it.

NOTE: If any kind archive administrators would like to volunteer to
give the Unnkulian games a home at their site(s), we'd be grateful.
The umich archives seem to be slated for termination, despite
everyone's best efforts to prevent their demise. With this in mind, if
you have an anonymous FTP site with PC or Mac software and wouldn't
mind keeping the UU games on your machine, please let me know via
email. Thanks. (The Atari versions seem safe at atari.archive.umich.edu,
which looks like it will stay up entirely on volunteer support.)
*---------------------------------------------------------------------------*

[I post this message approximately once a month. This version has some
new text about why we don't have Amiga or Unix versions, and about where to
obtain the TADS system via FTP.]

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with
great puzzles and evocative descriptions without resorting to using
any graphics at all? We really miss Infocom's emphasis on gameplay
rather than glitz, so we've decided to write our own adventure games
along the lines of those Infocoms we liked so much.

If you're looking for top-quality interactive fiction comparable to
Infocom's commercial offerings, check out the Unnkulian Unventure
series of games, shareware text adventures available from an archive
site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of
Kuulest's slave, and must recover the Orb of Studosity from the evil
Unnkulians. Kuulest, the old geezebag, has died and left you with
nothing to go on but a cryptic message about saving the planet. You'll
encounter amazing Acme products, the infamous Guardian, those witty
creatures known as Drolls, a giant beaver, and even the Unnkulian
Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure
continues as you try to create some good press for yourself -- wouldn't
want to fade into anonymous obscurity, now would you? Along the way,
you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
```

o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdhist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

The Unnkulian Unventure games have already gotten rave reviews from numerous Infocom addicts and other adventure game connoisseurs, so why not give them a try?

The games are available for FTP:

PC and compatibles:
---

msdos.archive.umich.edu:

msdos/games/textadv/unnkul12.arc
msdos/games/textadv/unnk2v20.zip

NOTE: Newly uploaded files reside in msdos/UPLOADS.
Look there first for the latest version.

Mac:
---

mac.archive.umich.edu:

mac/games/adventure/unnkulian1.03.sit.hqx
mac/games/adventure/unnkuliantwo2.0.sit.hqx

Atari ST:
---

atari.archive.umich.edu:

atari/games/tads/unnkul12.arc
atari/games/tads/unnk2v20.arc

Amiga and Unix:

We get a lot of requests for Amiga and Unix versions of our games. We'd love to have versions running on all the major machines, but unfortunately converting our games to other platforms is beyond our control since the games were written with a system called TADS; TADS only runs on PC's, Mac's, and Atari ST's. If you'd like to know about plans to port TADS to other platforms (if there are any such plans), you can send email to Mike Roberts, principal author of TADS, at <73737.417@compuserve.com>.

He gets flooded with mail about this every time I post this message, though, so please be kind and brief for his sake.

Notes on where to obtain TADS itself are included in
Appendix A.

Both Unnkulian games are shareware ($10 registration fee for each) --
registering gets you maps and hints sheets from the authors. Support
us and you'll continue to see fun text adventures like these that fill
the void left by Infocom's disappearance.

Questions and comments are welcome!

Dave Baggett
dmb@wam.umd.edu

Appendix A

Where to get TADS via FTP:

TADS is available for the PC, Mac, and Atari ST, from the following sites:

msdos.archive.umich.edu: msdos/games/textadv/tads.zip
atari.archive.umich.edu: atari/games/tads/tads.lzh
mac.archive.umich.edu: mac/games/games.utilities/tads1.04.cpt.hqx

TADS is also shareware, and we strongly encourage you to register if
you use it since we feel it is a powerful, innovative, and very inexpensive
development system that deserves to be paid for.

The bj10e cartidge runs out ver suddenly, and is quite expensive to replace.
But there are refill kits available: try the Yellow Pages and ask suppliers
or re-inkers if they do a kit. The kits work well, in my experience.

2604. ATARI ATW800

Newsgroup: comp.sys.atari.st
Date: 1992-03-15 23:47:12 UTC
From: bgervin@ncrcan.Canada.NCR.CA
Message-ID: <10213@ncrcan.Canada.NCR.CA>
Source record: 224690

Could somebody please tell me, if you know, what an ATARI ATW 800 and
about how much one of these is worth. It seems to be some sort of ST.
It accepts an SM1224 Monochrome monitor (and probably also a color), accepts
Atari Floppy Input, has one floppy built in, has a SCSI built in, has
MIDI IN/OUT Ports, RS232C, PARALLEL and what looks like a MEGA Keyboard
INPUT (RJ11 Jack). It is housed in a very heavy big tower case with a
make shift ATARI Sign on it. It boots up in GEM, although without a
MEGA Keyboard I can't examine it much further.

Inside are three motherboards (If you want to call them that). On top is
what looks to be an ST Board with 8 256 Chips, a Motorolla 68000 and
various other chips. This board is labelled ATARI I/O SubSystem. This
is where the SCSI, Floppy Controller and the Standard ST Ports come off.

Under that board is another board which is about half the size. I can't
see anything on it without doing major surgery.

The third board on the very bottom is about twice the size as the ATARI Board.
It is labelled ATW800 by Pelicon or something in England. It has an INMOS
chip and what looks to be 4 Megs of SIPPS. Off of this board are 4 ports
labeled Link 0 thru Link 3. Also coming off the 1st or 2nd board are
BNC Connectors, 3 Labelled R, G and B and a fourth unlabeled.

The machine was made in Germany in 1989. I can maybe get a hold of five of
these babies for sale. I believe the SCSI's to be 105 Mb NEC's. The
power supply is switchable 110, 220 and takes a standard IBM style
Power Cord.

Any suggestions, comments, inquiries invited. Perhaps it is the lost
Transputer?!?!

Geezus Bob. Then why has ST Informer, Current Notes, and AIM survived?

The problem with Antic and STart was the publishing company, not Atari Corp.
Their other magazines haven't done so well either.

>I hace read something about that new floppy controller chip
>for TT and Mega STE, but I just wonder if it fits to older
>models like Mega ST. Is there any more info about the thing,
>and can it be bought from somewhere?

I have had several occasions when I have received data that was destined for my Atari Mega ST2 that had been written on a 1.44 megabyte floppy. Of course my ST has only a 720 kilobyte floppy drive. One solution to this problem I have found is to bother a friend who as a PC and ask (gasp) to copy the file a 720 K disk.

I am wondering if perhaps there might be a supplier who has made a floppy drive that would allow either

(1) daisy chain to the DMA port, or
(2) attach to the SCSI port on the back of my ICD hard drive.

Any suggestions or other alternatives?

The problem with even affordable commercial disks is that users outside of Germany have trouble purchsing the product. I wish that authors of programs would investigate the methods for users from other countries to pay for the products before signing limited area contracts. Also, I would like to know how to pay shareware authors from different countries.

I don't mind learning the German language to be able to use programs, but I do mind not having the knowledge of how to adequately re-imberse shareware and commercial authors for their efforts.

>Their other magazines haven't done so well either.

Atari killed the market for Atari related products, which killed the
big magazines (and most of the third-party hardware and software
producers too).

Current Notes and AIM have survived because they're low-key, low-budget,
low-overhead operations. (Can't say from experience about ST Informer,
but I imagine that applies to them too).

STart, Antic, ANALOG, and ST-Log were not produced on the kitchen table
in the publishers' home...

If all that was wrong with Antic was their own doing, why hasn't ANOTHER
big-time magazine stepped into the market to take their place..?
(or Compute's ST's place, or ST-Log's place..)

Why hasn't Ziff-Davis or ABC Publications jumped at the chance to fill
the void in the lucrative Atari marketplace..?

I'll bet you already know the answers... you just don't like to admit it...

No, it doesn't, neither does it on the MegaSTE4...

>
> Thankful for every bit of Information I can get about it.

I wouldn't work with this stuff, it only likes TOS 1.04; but this is not
the current version supported by Atari. I was told in Hannover at the Cebit fair
that current versions are TOS 3.06 and TOS 2.06.

> BobR

Now, Bob, just 'cuz you've been angry at Atari ever since that GEnie fiasco...

The publishers of STart magazine are solely responsible for 'killing' the magazine. They were in deep trouble even before the final issue was released, and Atari had nothing to do with the actual demise of the magazine. Poor management combined with multiple magazine startups without sufficient capital are more likely responsible.

David Beckemeyer has written in several places about an attempt by a law firm to collect on already-paid bills, so there is STILL some legal entity which represents STart magazine.

On a similar note, this is not the first example of a company promising much and delivering little or nothing. I'm still mad at Paul "I got money from Apple and stiffed Atari Users" Haekel for refusing to refund monies paid for upgrades to ZoomRacks 3.

1) The era of machine-specific computer magazine start-ups has passed.

2) The domination of the U.S. markets by IBM and Apple products.

3) The change in readership from home-computer-oriented enthusiasts to
corporate business users.

4) The down-turn in computer sales in the late 1980s.

Need any more reasons?

My mail bounced so I post it to the net, as there might be someone else
who like the info.

In article <10213@ncrcan.Canada.NCR.CA> bgervin@ncrcan.Canada.NCR.CA () writes:

[about ATW deleted]
>
>Any suggestions, comments, inquiries invited. Perhaps it is the lost
>Transputer?!?!

Yep it is!!!!

Two friends of mine bought the last machines in France and Sweden. The
price in France was a little program to make screen-shots of the LYNX
(they wrote it for Atari France) and the price for the swedish ATW was
SEK 5000 (less than USD 1000). The swedish ATW had 5 Transputers (one
as you describe it, with 4 MB of memory and 4 with 1 Mb each). The French
ATW was plain vanillia as you describe it.
The I/O-sub-module is in fact a MEGA-ST 2, and can be used as a ST in
most aspect's. The ATW (Atari Transputer Workstation) was made in about
4000 ex and most of them was sold to Kodak. They have a very competent
graphics-card, and I think Kodak used them a little like the Paintbox.
The ATW you describe is not very competent - you need more than one
transputer to get it run fast. The maximum number of transputers in one
ATW is 64, and that would make one hell of a fast computer. The sad part
is that only the T805 (T800 is now outdated, so selling it would be hard)
costs about USD 300. There is a chance that your best bet is to sell the
ATW in parts - 4*1 Mb + 8*256 Kb (gives about USD 250), SCSI-drive (used)
might give about USD 300 and the T800 about USD 200 (as it is outdated and
used) but I don't know if all chips are in sockets (If they're not - bad
luck...). The graphic's card is almost worth-less (you may build your own
for about USD 60, and no-one without a ATW will be able to use it).
As you see the price is VERY low, but on the other hand - there are
no programs to it, and there will never be.
Personally I am prepared to pay about USD 800, for a vanillia ATW, but
that includes shipping! The fact is that it is unsupported and almost also
useless.

If you get any further info on the subject, please mail me, I just love
that old dinosaur Atari have made;-) (an ATW is heavy, about 30 kg). Also
mail if you decide to sell one for me...

>a full copy of WriteNOW (still retailing at 45 quid).
Sorry, that should have been "Write ON" (from Compo Software, baby brother to "That's Write"). A friend with both Write-On and That's-Write tells me that the upgrade is not worth the extra cash - you can do all the nice font stuff with Write-ON.

Time to order my bubblejet - the daisywheel that I've been using with FirstWord+ is too low tech for this new software....

Get the german program TURNO-ASSEMBLER. All docs in german, but it's (in my view) a match for DEVPAC 2 by HiSoft once you work out what the german commands mean. Has it's own debugger, optimiser & a resource construction kit that come with it. It's available on atari.archive.

For all it's worth in Atari France's magazine (you guessed it: Atari Magazine) they have a very nice article concerning Neochrome Master. It's as if they owned it. And it is available on their videotext BBS: (+33) 36-15 ATARI.

Get BSPLIT which splits such large binary files. Otherwise, std.
SPLIT on a Unix box would work. Of course you need either GNU CAT or
GNU EMACS to reassemble the original file.

> michael doser

You will find some storm sounds in a.a in:

atari/sound/mods

and it is called:

rainynit.arc

This contains rain and thunder in a song, but it can be seperated from
the music. It is a noisetracker module and it is one of the best I have
heard.

Hope that helps.

Andy.

2626. TapeBIOS and GNU Tar for SCSI Tape Streamers

Newsgroup: comp.sys.atari.st
Date: 1992-03-16 14:25:37 UTC
From: alanh@logitek.co.uk
Message-ID: <alanh.700755937@krypton>
Source record: 224639

Hi Everyone,

Well, I have completed a small project to develop a nice interface to
provide access to a SCSI Tape Streamer connected to the Atari's DMA bus, it may
work with the Atari TT's DMA bus if the DMA registers are in the same places.

Anyway, part of the code has been taken from Paul Moreaus initial code
and has helped develop a good TapeBIOS interface for programmers to use.

Included within the package are: programmers docs, include files for
GNU 'C', Library files for GNU 'C', support programs allowing you to dump
partitions to tape of any sector size, restore and dumpdir programs too. Also,
an mt utility to help manipulate the tape resource.

I will be posting this within the week and also my port of GNU tar
v1.10 which also supports the SCSI tape streamer.

Any feedback, let me know now....

2628. DVI-drivers, how do I write one?

Newsgroup: comp.sys.atari.st
Date: 1992-03-16 14:48:54 UTC
From: rfschaa@cs.vu.nl
Message-ID: <13376@star.cs.vu.nl>
Source record: 224618

I am trying to write a DVI driver for some device. The problem is
that I have no idea where to start. Questions that come to mind are:

- what functions should the driver perform?
- what is the structure of a driver?
- how do I force VDI to use my driver?

I have tried to look up the information, but all the books I can
find skip the issue of drivers or just mention that a driver is
a 'program without the header' (whatever that may mean...)

Is there anyone out there that can help me out?

Thanks in advance,
Richard

Yeah, I agree. However, it might also be worth keeping an eye out for
Atari ST User... next month they are putting something special on the
cover disk....

Cant remember what offhand, but I remember I saw the ad, and went 'Hmmmm
must get that one...'.

BTW I am not connected in any way to either of the magazines.

I must admit I get very pissed off with those stupid 'Game Demos' the magazines
put on the cover disks. They take up a large proportion on cover disk space,
and usually put me right off the game in question, even if I had considered
possibly checking it out.

Total trash, I'm afraid.

Umm.. ST Format was definitly the better mag, but ST User is, in my opinion
catching up fast. They are expanding all the time. At the moment they seem
to be neck and neck, but both magazines can be very childish - stupid kiddie
'humour'. St Format is worse.

The thing that REALLY annoyed me about ST Format was that pathetic (PATHETIC!)
cover disk 'magic eye' that they put on the cover disk. Written in STOS basic
(not that that makes it bad, but it usually makes it take up lots of KKK's)
and all it did was play a sample and flash a few pictures on the screen.
A decent assembly program could have done it in about 1-3k I guess, not

including graphics.

The best bit was, that the 'demo' was written by the ST Format cover disk editor. Need I say more?

St Formats policy of keeping all disks sent in for cover disk submissions is also definitly anti-social, and downright arrogant if you ask me. I dont know wether User do the same.

On the other hand, I got the last issue of 'St User' which has a complete game written with the new 3D STOS extension, and the game jsut reports a STOS error. Number 34 I think (or 32).... They could at least check it works before they waste 200k on it.

Enough grumbling :-)

I really miss the old ST WORLD magazine. Definitly the best. Knocks socks off of all the useless 'learn assembler' courses in the current rags. I still find myself looking through the 88-89 copies of ST World (I have from Nov 87 to the last issu) for useful info, regarding OS bugs, little known file formats (they explained GEM Metafiles years ago).

Mr Andreas Romanos (sp?) highly recommended ST WORLD in his 2nd Manual for the ST.

Sorry about the long post! Probably seems like a long grumble, but, with magazine prices between 3 and 4 quid I think critisism is justified.

2631. Prolog with Garbage Collection?

Newsgroup: comp.sys.atari.st
Date: 1992-03-16 15:13:44 UTC
From: dea@hplb.hpl.hp.com
Message-ID: <1992Mar16.151344.25162@hplb.hpl.hp.com>
Source record: 224632

I'm looking for a public domain prolog that runs on the Atari St that has garbage collection. I've used the University of New South Wales Prolog, but that crashes before very long even with the maximum memory allocation (I've got an application that involves a lot of data processing, but Prolog is the language of choice for reasons I won't go into ...).

I have heard about Prologs available for the St, but none that have garbage collection. Does such a thing exist??

Thanks in anticipation of information.

>I'm wanting to do this so that I can put Z-Term onto a disk for a new BBS user
>(without any comms software!!)
>
>Answers on the back of a 720k disk to.....
>

The way I have done this is to approach it from the other direction. Get a mac with a Superdrive and use Apple file Exchange. Put the program on a standard IBM 720K 3.5 disk (no problem with TOS 1.4, I hear; must use an IBM formatter like DCFORMAT for TOS < 1.4) then under AFE the mac will read the disk. From there it is a simple transfer, just like copying files.

I work in a computer lab with Macs, so I usually FTP files to the Mac then copy the files on to 720K IBM disks then take that disk home to the ST and copy onto my hard disk.

Hope this helps!

>Thankful for every bit of Information I can get about it.

>Ciao
> Atarico

Winx is a PD program that enables you to have up to 128 windows simultanously
on your ST/TT. The max. number of windows is controlled over the name of
the progrem (e.g. winx32.prg for 32 windows). In reality, the number of
windows is dependant on the speed/memory equipment of your system. A 1meg
ST with 8MHz can't handle more than 16 windows in acceptable time.

I don't own winx*, but it's said it will run v e r y well on TTs, especially
with the MultiGem-*Pseudo*-Multitasking system.

(My informations are based on an article in ST Zeitschrift I read some times
ago, so be aware of mistakes)

>
>The problem with Antic and STart was the publishing company, not Atari Corp.
>Their other magazines haven't done so well either.
>

I think the intent of Bob's comment was to point out that Atari has failed
to create a market where a nationally distributed glossy is a viable
business venture.

No market -> No users -> No Software sales -> No Developers -> No Advertising
Revenue -> No magazine. QED.

Antic Publishing could never be called a well managed business. However,
thier exit from the nationally distributed ST glossy market is fundementally
a result of extreme weakness in the ST market. Analog, ST Log, and
Compute's ST preceeded STart's exit from the market. The fundemental reason
was that the publishers could gain a greater return on investment in other
markets. Although they are very high quality publications, ST Informer,
Current Notes, and AIM are not in the same league as a nationally distributed
glossy magazine and represent the level of journalism that the current
ST market can support.

Wasn't that impressed with it myself - all the flash bits and none of
the basics (like a spell checker). I also miss the scrollbar - Write
ON's display just seems to disappear off the page. As for the output,
it was very fuzzy on my 9-Pin, so I'll stick to First Word Plus and
Fontprint, for the time being (but for and extra quid, I don't feel I've
been conned _too_ badly :-)). Shame the 1st Word import doesn't work
properly either. I did like the font handling though - does anybody know
how Calligrapher junior compares ?

Sam.

Those missing the old ST WORLD would probably enjoy the ST Club's mag 'ST Applications' - nothing glossy, but lots of intelligent articles and reviews that give plenty of space to details instead of naff photographs. ST Format's move to 'mini reviews' says it all (bugger all). Applications also has a 'Forum' section, and regular articles by ST 'personalities' such as Gunter Minnerup (sp?). It's subscription only, but they usually send a sample copy if you request a PD catalogue. Not childish, not arrogant, and not connected to me.

Sam.

A friend of mine saved up for years to buy his own ST. He later realised he should have bought someone else's.

I have some noisetracker .MODs that contain wind sounds. One sample is called
SUPERWIND, I can't recall other names right now.
If you send me your email address I could send them to you as uuencoded files

>(but we know Atari ;-<)

I talked to Frank Ostrowski at the GFA pavillon and he told me that MultiTOS
ran only on a TT because it needed the 68030 ... but then, who knows, maybe
Atari will release a version for the ST sooner or later, just as the STe-TOS
was ported to the ST.
I could not find out whether MultiTOS was based on MiNT, but if so, there
should not be any major problem in creating an ST version.

No Greg, no one would mistake you for a rebel. A bit confused at
times, likely to come out with idiotic opinions on the spur of the
moment, flame with little provocation (or facts), totally unfamiliar
with the documentation in the new.user group, but never a rebel.
But don't worry, anyone who really cares probably has you in their
killfile anyway.

I suppose Atari killed Antic's Amiga magazine as well. As has been
posted by people who were in a position to know, STart was drained of
the profit it WAS making to finance Antic's unsuccessful ventures into
other forums.
This is the second time you've tried to spread this misinformation.
Why?

>Macintosh compatible disk.
>I'm wanting to do this so that I can put Z-Term onto a disk for a new BBS user
>(without any comms software!!)

If the mac-guy (you or the other?) has a computer with super-drive, you can do the following: put the file on a DOS-formatted disk. Then use a program like Access-PC or DOS-mounter on the Mac to read the disk. The problem is, that now the file will be of type TEXT, creator ???? (or something like it). So you have to change (at least) the type of the file to the appropriate one (don't know which type it should be...). Changing type's and creator's can be done with ResEdit or other suitable software.
I think you'd best pack the whole thing so you've only got to worry about one file...
Hope this is any help. the problem is not completely trivial without modem or other suitable hardware.

You're wrong here bob. STart was actually making a profit, but it was
being siphoned off to pay for PC home journal. They killed it because of
other problems with his compnay, and that was the only way to do things
so that he was not liable to anyone for monetary damages.

2647. HD's & STE's DMA

Newsgroup: comp.sys.atari.st
Date: 1992-03-16 22:36:12 UTC
From: shore@equinox.gen.nz
Message-ID: <2a4qHB1w164w@equinox.gen.nz>
Source record: 224555

Can someone give me the actual facts on what will
happen when using an STE with the faulty DMA chip?

I've got a Quantum 105 meg drive with a ICD AdSCSI Plus interface.

I'm having problems with it... last night I finished using it
after using it for about 5 hours, and a few sessions before that
were equally as long. When I turned it on this morning, it would
not boot. After messing around with some of the programs that
came with it, I managed to get it going again. I don't know what
I did!.
Then tonight, while copying files to drive E, it corrupted & the computer
crashed.
When trying to reboot, again it would not. I again played around with the
programs on the ICD disc, and got it going again. I then tried drive
E again, but no luck... it was corrupted. After rebooting, I was having
a look at some other drives & drive C dissappeared!! Then it wouldn't
boot again. I haven't got it going again :-(

What could be the cause of this? I was lead to believe that the STE's DMA
probs would show within 2 hours... I got at least 15, prob closer to 20
before I had any problems.

Thanks,'
Craig.

I have the following items for sale for the Atari ST :

CALAMUS - desktop publishing program $110

CALAMUS Outline Art - allows you to draw pictures $100
for CALAMUS

CALAMUS font editor - Allows you to create and edit $50
fonts.

These items CAN be re-registered to the new owner.

2649. 52Meg Supra H/D - Good Buy?

Newsgroup: comp.sys.atari.st
Date: 1992-03-16 23:18:17 UTC
From: friedric@mdd.comm.mot.com
Message-ID: <1992Mar16.231817.16993@mdd.comm.mot.com>
Source record: 224635

I'm in the market for a NEW hard drive, and E.A. Brown is selling an
11ms access time 52Meg Supra hard drive, completely formated, case, cables,
host adapter, etc. for US $400.

This sounds like a decent deal, but am concerned about the reliability of
the product. Apparently the drive is a Quantum (with a 2 year warranty).

Anybody know anything about Supra drives? Are they reliable?

2650. Atari UK drop prices

Newsgroup: comp.sys.atari.st
Date: 1992-03-16 23:59:48 UTC
From: hrs@aber.ac.uk
Message-ID: <1992Mar16.235948.8433@aber.ac.uk>
Source record: 224637

So Atari UK have finally done it! Done what? They've dropped their prices
for the MegaSTE and TT range. I'd heard a month ago that they were going to
do it although I thought they might have been able to drop their prices by
a bit more that they did. Sadly it still works out cheaper to buy a Max II si
+ high res colour monitor than a TT (at least for educational).

The new prices are: TT030/2 1169 pounds (no HD or monitor)
TT030/8 1874 pounds (")

MegaSTE1 586 pounds (")
MegaSTE4 815 pounds (")

These figures probably include VAT.
All prices from ST Format and ST User. A 50MB HD for the TT costs 464 pounds !!
and then its only a seagate 157 - what a rip off. One can get a 105 MB Quantum
+ interface board for less than 464. The colour VGA monitor is priced at 405
pounds.

At least these prices changes are in the right direction, but come on Atari lets
see some more price reductions!! If one includes HD and VGA monitor (the
Atari one) the price comes to almost the equivalent of two 486 systems!! Not
quite yet `Power without the price'?

Well, I don't know what all the fuss is about - my copy of Gulam uses
ESC as the filename completer and the meta key in Emacs, works fine.
I use ESC < and ESC > all the time to go to beginning and end of file.

Here in NZ, we have the UK machines that run at 50hz have the European
date format and have different key boards..

If you use USA Roms you will get a 60hz machine with USA date format
and a few of the keys will not be the same..

Also some software that is sold here will not work in a USA machine,
like Pagestreem and Calamus..

Why can we get these some of these tech articles be reprinted is some kind
of Book. ?

I have a few ST-Worlds and I completely agree with you.

There is a funny thing about UK magzine companies, they never heard of Annuals
any more, they could have reprinted some of the techy stuff in a
Annual, like what Compute did and some of the OZZy magazines do, it
would be so easy to do as they allready have the stuff..

The ATW is indeed the Atari Transputer Workstation. The ST is merely a front end for it. They have been on sale for a number of years and are still available from and supported by Atari. I saw some tasty graphics software which used a Kodak colour scanner and printer to allow cut & paste along with various effects using 35m pictures. The final output was as near identical to the original picture as you can get. V. impressive.
It was designed by Perilion who also developed the multitasking OS.
Your machine sounds like a 'baby'. Transputer farm cards could be added to make a machie with over 100 mips.

A lot were sold to universities etc. in various countries

Your configuration sounds close to my own. Do M-X compile/next-error
work? Do they work with MiNT active? I have done some work on a
MiNT-based port of JOVE, and I have these features working. I will
switch to emacs, if I don't have to sacrifice them.

I have picked up on a couple of things lately which should help me
finish the port of JOVE. On this note, does the XBIOS keytbl() routine
work with the ST function keys? Can anyone mail me example code?

The point, which was roundly missed by most, is that Atari Corp has failed to develop a marketplace which will support the existance of third-party companies supplying magazines, software, hardware, and other peripherial products.

This is not misinformation, or speculation... you only have to have your eyes open and count the number of companies which have lost everything they put into trying to make a living in the Atari market.

So Jim Capparall turned out to be a crook... do you think he entered the Atari marketplace in April of 1982 with the intention of running off to the IBM market with subscribers' money in 1991?

I think not... his ANTIC magazine was a top-notch source of information for Atari computer owners for many years. STart magazine, whatever your own personal opinion of it, was another good source of information.

The failure of ANTIC to stay in the Atari marketplace can be placed solidly at Atari Corporation's door.

Had they developed, produced, advertised, marketed, and actually delivered computers in quantities to people who would then have bought Atari related magazines and software, there would have been no reason to try to siphon off ANTIC's assets and start a new magazine in a different, more viable marketplace.

Instead, Atari killed the US market for Atari-related products, and ANTIC, along with many other third-parties, tried to survive by going elsewhere.

Note that I'm *NOT* defending the way ANTIC effectively stole their subscribers' money.

I *do* place the blame squarely where it belongs, with Atari Corporation.

>catching up fast. They are expanding all the time. At the moment they seem
>to be neck and neck, but both magazines can be very childish - stupid kiddie
>'humour'. St Format is worse.

I agree. The immature 'humuor' does get my goat.

What I really hate about ST User:

* Little or no programming. Why don't they bung Sozobon C on the
cover disk like ST Format did then start having C,Assembler and GEM
programming forums.

* Big thick page borders to waste paper because the article is
small. Did you notice how big a deal they made when they made the
magazine bigger. What a con. Putting pictures at all angles is also
another tactic.

* The Gamer Section. They should just lose it.
The video review section is irrelevant too.

* Bright colours and banners everywhere.
It's like a trip to the circus!

Yes I guess what I'm saying is that I'd like to see the return of ST World
with a heavy programming side to it.

>Mr Andreas Romanos (sp?) highly recommended ST WORLD in his 2nd Manual for the
>ST.

Ramos is the tube who said that TOS 1.4 was only a slight upgrade and wasn't
worth bothering with! I believe his second manual is good for beginners though.

>Sorry about the long post! Probably seems like a long grumble, but, with
>magazine prices between 3 and 4 quid I think critisism is justified.

True. I'd like to see magazines cut to about 2 quid or less with far less
glossy colour pages.

>
>
> Anybody know anything about Supra drives? Are they reliable?

These drives are one of the best you can bye, but the supra software is
a bit of a pig, we fitted a New Quantum LPS52S to a stuffed Supra 20 meg drive,
and tried to format it with the lastest Supra software V4.11 from memory,
the version that was posted on GEnie, It reported the drive as suffed,
to many errors,there is no selection for the Qantum LPS 52S, only a 52S,
we since found out that you can't format these New Quantum drives..

Patched ICD Software worked 100%...

There is one other problem, the Supra host adapter will not let the
disk drives work when the HD is powered off, you have to unplug
the DMA connector, also the clock battery would not last to long in
the older adapters, they should now be fitted with a Dallas clock
chip that lasts 10 years..

I am using a Supra host adapter..

>Transputer?!?!

The ATW IS the Atari Transputer Workstation, which was developed by Perhilion in England. The OS it actually runs is called HELIOS and is a true distributed system. More proccessor cards can be added to the 'Farm' up to a maximum of 8, giving some wicked processing power. I beleive that Hull University in England has quite a lot of these workstations, as the Atari Roadshow borrowed a few processor boards from them to show of exactly what a fully powered up ATW was capable of. Ouch.....that was awesome!!!

Do you want to sell that workstation ?????

You have MGR set up wrong. Cann't get a pty means that the program cann't find (or hasn't got enough memory to run) a command line program. I've got MGR set up to run off one 720K floppy with 1 Meg of memory on an original 520ST (had to fit a modulator to plug a TV in) and it runs OK.

I'm converting the MGR libraries to HiSoft Power Basic at the moment. If any ones interested in getting a copy when I'm done, email me on:

Craig.Graham@newcastle.ac.uk

I'll post a note sometime giving COMPREHENSIVE small system installation notes for MGR.

Yup, it's the Atari Transputer Workstation. It also is a `sort of ST' since it contains a Mega ST it uses for I/O (at least that's what all the magazine articles said, years ago ...)

How did you get hold of these beasts ?

Could anyone Email me with a list of FTP addresses that is for the ST.
As I have just found out about FTP in general I would appreciate it alot.
Is there especially any ones that have PD programs that can be downloaded
onto an IBM disk which will work on my ST.

Thanks alot for every ones help,

Simon

2676. VDI drivers, how do I write one?

Newsgroup: comp.sys.atari.st
Date: 1992-03-17 12:45:55 UTC
From: rfschaa@cs.vu.nl
Message-ID: <13399@star.cs.vu.nl>
Source record: 224566

I am trying to write a VDI driver for some device (not a DVI driver,
but a VDI driver!!). The problem is that I have no idea where to start.
Questions that come to mind are:

- what functions should the driver perform (lines/circles, ...)?
- what is the structure of a driver?
- how do I force VDI to use my driver?

I have tried to look up the information, but all the books I can
find skip the issue of drivers or just mention that a driver is
a 'program without the header' (whatever that may mean...)

Is there anyone out there that can help me out?

Thanks in advance,
Richard

>etc.
>[...]
>-Jason Heideloff
>heidelj@alleg.edu

Totally unnecessary. This group's volume is too low to warrent split like
that of comp.sys.amiga's. However, I would suggest two additional groups:

comp.sys.atari.tt
comp.sys.atari[.st].forsale

Of course, given the current method of naming, if .st.forsale was to be
created, .st would have to be changed to .st.misc...

From: whitcomb@aurs01.uucp
Message-ID: <60421@aurs01.UUCP>
Source record: 224571

I finally sat down a few weeks back and really tried out that Llamatron game that's been lurking on my hard drive for months and months. What a blast! The graphics may not be state of the art, but gameplay is great (especially when using two joystics), and the samples are hilarious. I remember reading a while ago that there was a way to get the game to play uncensored samples (that don't cut off after the 'F' in "Awwww, F---"). Anyone know how to do this (just to save me from having to say it myself all the time)?

I sent in my shareware fee and Llamasoft promptly sent me their newsletter and a copy of the game "Andes Attack", which is a very good "Defender" type game with a few added twists. Jeff Minter does program a mean arcade game! If you haven't sent in your shareware fee for Llamatron, I suggest you do it for the free game, if not just to ease your conscience... the 5 pound shareware fee plus 1 pound postage (roughly ten dollars US) are well worth it. And if you haven't tried Llamatron, you're missing out on a whole lot of fun!

ST/Ste. I would like to see programs of any description and length, as I am trying to learn the language at the present time. If there are any suitable source codes out there, I would be very interested to see them.

Many thanks,
Jon.

I somewhat remember a program in the atari archives at UofM which did redirection of printer output to disk. That would be the only way I know, it is tricky to use as I remember (Atari gets confused sometimes/always when you access a file while the program is in the middle of doing the same).

Of course, you could always get a second Atari and hook it up with a null modem cable thru the serial port, and get it to record whatever is pouring into the serial port. You'll need to set no x-on/x-off, maybe rts/cts on both computers. I think it would be quite an amount of data, expecting at least a Megabyte.

None of those published what Antic did, did they? Antic publications were
better than the Atari developer deal (they still are!)

Atari has a habbit of trying to expand vertically towards third party
developers, and their developers contract is designed just for that purpose.

The recent announcement of them that they are making the developer kit
available for *users* shows that many developers are aware of Atari's
expansion policy, and naturaly, new developers will avoid the company
altogether. They managed to loose the dealers, now it is the developers.
Soon enough, customers will follow.

Too bad, that there are no Atari clones.

Right now, the Intel family 386/486 delivers more bang for the buck, and
they are getting dirt cheap. With unix being available in a serious manner,
I predict that not only Atari will loose its market, but also the 68XXX line
will suffer heavy losses.

Don't get me wrong, we use 6 ST's for business and many of our customers,
however, we will migrate to the 486 platform for sure.

But I hate even more paying $$s for a magazine only to laugh hyterically
at its "feature" program.
Crap games don't need to be exposed in bytes (as it were). A sufficently
savage review will do just nicely for me.

However GOOD games/programs, well...I'd like proof of *that*.

Source record: 224575

Latest version of HACKUS Full Screen Edit:

This version corrects some last minute NASTY bugs, now squished, that sometimes droppped the filename extensions for FoReM, Citadel, ACICS BBS systems.

The serial port records are now saved, however double buffering has been left in as a request by some to keep editing speed above the pokey 2400 bps most of us enjoy online.

Event looping has been added to provide possible compatibility with Multi-GEM, Mult-TOS in the future. The has real world benefits now as carrier detect is now automatically detected for local and online modes... as well as more robust event detection for carrier loss, DTR cut..etc.

ANSI emulation bugs have been fixed. No more unexpected killed lines when you use the arrow keys.

Problems:

Argument parameters must have accurate parms, or KA BOOM.
(Minor fix for those who support their local shareware authors :)

Groupware Experiment.

CHAT.TTP

This is a new piece of software, with several modules that provide serial information exchange in a multi window chat mode like environment for the ST. Sort of like UNIX Talk, DEC Phone..(Well, its fairly based on these sort of programs in more ways that one...) which also provides the ability for two people to work on a single or multiple files at same time...collaborative editing so to speak.

At this point and time you can`t save the editing you do, still working on that one...but it is a rather interesting experience. (I use mine mainly to instruct software upgrades long distance for ACICS.)

Its very new, supports VT52 and ANSI, and has some quirks yet, but is still very useable.

The shareware price is $10 for both programs.

I usually never distribute my software over the net, this is my first try. I seem to be lacking in the social graces here so I thought I better put up or shut up. :)

I sorta gave up! The Bob Brodie says netted to 70+ boards & I believe will only respond to messages in ZNET or one conference anyway. No cross-posting encouraged, but he can get E-mail from other nodes. Someone else says 100's of boards are netted. Doesn't really matter to me since Atari Base & Steve's BBS are both local for me. That's for adding some more names. Contributing to the list is the best way to make it better.
Rick (Whoops That's=>Thanks above)

Yes there is an assembler available, however it is shareware. It is called the Turbo Assembler and it was done by the same people that did Omikron Basic. It is a full optimizing assembler with an integrated debugger... I haven't used it much, but it looks to be quite nice. Professional quality at a shareware price!

>
> Anders Skelander

I'd sure like to know more about it. What was posted in comp.sys.amiga.advocacy sounded pretty impressive:

$1200 for a fast 68030 with a hard drive, multi-TOS, 640x480 display with a 64K color (16-bit) pallate. Four controllers, two digital and two analog. MC65001 DSP. Expandable to 128 Mb RAM. For more info, look in c.s.a.advocacy <grin> under the subject "Falcon".

Someone else (?) claimed that it would be available in the US in April, which I have trouble believing.

For that price, I could be talked into buying another Atari computer. Especially if someone ported Unix to it.

> work with the ST function keys? Can anyone mail me example code?

A suggestion for anyone writing programs for use under MiNT: don't use Keytbl() in any application if MiNT is active. Why? Because it's a global change to the whole system, and other programs may not be happy about such a change (e.g. consider two editors with two different ideas about how function keys should be re-mapped, running in different windows at the same time).

If you can wait for the long promised and long delayed MiNT 0.93 (yes, it really will be ready Real Soon Now!) there will be an ioctl() call for changing function and cursor key mappings that will work on a per-terminal (i.e. per-window) basis and will also not interfere with existing programs that use the BIOS to read the cursor keys (this is another disadvantage of Keytbl). Plus, the ALT key will be usable as a META key (but only for letters A-Z, and then only when there's no ASCII equivalent already established; this will avoid problems with different national keyboards).

2696. new versions of tcsh and mntlib

Newsgroup: comp.sys.atari.st
Date: 1992-03-17 21:45:07 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992Mar17.164508.1042@uwovax.uwo.ca>
Source record: 224583
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've uploaded new versions of tcsh and mntlib to atari.archive.umich.edu.
See mint/tcsh.zoo and mint/mnt{inc,lib,olb}19.zoo.

This version of tcsh works correctly in windows, and doesn't choke on
files with carriage returns in them (the latter bug was causing all kinds
of weird symptoms and took me a long time to track down!). Again, it's
been tested only under MiNT, but probably works OK under TOS as long
as you don't do anything fancy (pipes are considered "fancy" here).

The new version of the MiNT library contains support for Sozobon 1.33i and
2.00, courtesy of Dave Gymer. There are also lots of bug fixes, and
some support for new features that will be available in MiNT 0.93.

This definately looks like a faulty DMA chip :-(Sometimes the disk gets corrupted within just a few minutes, but it could also run fine several hours.

I had a STE with faulty DMA-chip some time ago and when I tested it with a special program it ran fine for almost 4 hours. The program creates SEVERAL folders and fills each folder with SEVERAL small files and then removes everything and checks the file-system. You can imagine how disk-intensive it is. And it ran for almost FOUR hours the second time I ran it. The first time it stopped after about 20 minutes and reported a file-system error.

Return your computer and ask them to replace the DMA-chip with a newer one. BTW, this error should only appear on computers made in 1990 (if memory serves me).

Greetings.

I have for sale the following equipment:

Atari 1040STf MC68000 based computer system.
4 Megabytes 80NS 1Mbit DRAM in Zubair Z-RAM 3D Configuration
720K 3 1/2" Floppy Drive (Internal)
MIDI In and Out
Serial Port
Parallel Port
2 Joystick ports
2 Button Mouse
SCSI Port
Extended Keyboard with Megatouch Springs

D&P Computers under monitor drive case w/ power supply
2 Drive Bays
ICD Host Adapter Plus (with clock) (SCSI Controller Card)
Seagate ST296N SCSI 85 Megabyte 28ms Hard Drive

Color Monitor

Monochrome Monitor

Monitor Master (monitor switchbox)

Casio HT-700 MIDI Analog Synthesizer

System currently set up for C language development running
GNU C, C++, and utilities, TeX, MiNT (multitasking environment),
and various other software.

This system is ideal for basic 68000 developers or MIDI enthusiasts.

Offer me $1000 and its yours. . . You pay shipping.

Thanks,
jdemlow@andy.bgsu.edu

Bob, take a pill. Any pill.

I'm sure I'm not the only net.atarian who "got your point", but I have to flatly disagree with you. In a nutshell, your primary argument is that Antic/Start's demise is Atari's fault, for not creating an American presence strong enough to support a large reader base for the magazine(s).

To be frank, that is one of the DUMBEST things I've ever heard. I have a lot of bad things to say about the Tramiels and Atari management, but I do not think that one of Atari's "responsibilities" is to make a market big enough to support any magazines (or other peripheral industries) that want to be associated with the product.

Atari is out to sell computers and make money. Period. I don't expect too much else from them, aside from some quality customer support. I don't expect anything more from any other company, either; you seem to have an unrealistic expectation of what Atari's duties and responsibilites are, and are now bashing them for the demise of Antic/STart due to a perceived failure ot meeting these unrealistic expectations.

What next? Are you going to blame Atari Corp. because AtariUser magazine is not printed on slick paper and comes 200+ pages a month? Or that it's Atari's fault that the computers weren't promoted heavily enough for the Bush administration to buy more STs and save enough money to lower the deficit? Or that, if Atari sold more Lynxes, then people would buy fewer Nintendos and Segas and then the trade imbalance with Japan will go down?

Geez...

It's been a week, and Atari haven't officially put announcements all over the place. I'd put this in the realm of 'concept cars'. The way I hear it, the machine that has caused all the excitement shown off the floor to a selectd group of people who shouldn't have talked about it. I wouldn't conclude much on that basis: it may not have been the only 'super' machine Atari showed to selected people. It may not relate closely to a machine slated for commercial introductiopn. Nearly anything might be true. Until there's an official announcement, this thing isn't even as substantial as vapor.

2704. New version of sample player (play.prg) on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-03-18 05:44:33 UTC
From: dmb@wam.umd.edu
Message-ID: <1992Mar18.054433.6693@wam.umd.edu>
Source record: 224591

Jeff Weiner's just put up version 2.0 of QD Play, my command line sample player, on atari.archive. New features include:

o STe 8-bit DAC support,
o Play stereo sounds on STe using DMA or MFP for timing (using the MFP for timing reduces sound quality but allows playback of stereo sounds at any sample rate)
o Play stereo sounds on mono devices (the two channels get mixed)
o Play sample in reverse
o Loop sample 10 times or until keypress
o Play samples stored in both the standard byte formats: signed and unsigned.

It's simple but speedy, and provides (IMHO) a convenient way to try out samples you download. It's in

atari.archive.umich.edu:atari/sound/players/play20.zoo

The zoo file includes a sample of each type to get you started and documentation that describes the options and a few hints about samples on the ST in general.

Well, since it sounds like a good one and a few has asked for where is it,
It's in one of German FTP site.
Sorry forgot about the name of the site, but it has a very slow link so won't
be good for north american ST user to FTP from there anyway.
So the next logical way is to put a copy of this package to atari.archive.umich
.edu, and it's in there in the new directory as winxv13.lzh. As soon as the
mediator on a.a.u.e has chance to check it out and move to appropriate
directory, any one interested will be able to get it from the a.a.u.e.

The archive is about 13KB in size, README file was in German so documents might
still in Germany.

ATARI finally revealed one of their bloodthirsty systemes at CeBIT:-
Falcon STe+ '30
===============
*MC68030 in a scream dive at 32Mhz, FPU optional
*MC56001 digital sig processor (DSP), stereo in/out
*Graphics- 640 x 480 65K simultaneous colors, video capture/overlay
*LAN/serial/parallel/quad joystick ports
*SCSI hard drive
*1.44 Mbyte 3.5" floppy
*16 Mbytes memory option
*Multitasking OS
*Price- around $1200!!!!
Coming up soon is the Falcon '040 with VME bus and the $200
Jaguar MAN (MAC-AMIGA-NINTINDO) eater. Hey, welcome to the jungle...
-Dave
================================================================================
Anyone been to CEBIT and saw this???? SH*T and all Commo gives us is
the A600/HD toy!??

From: smackinla@cc.curtin.edu.au
Message-ID: <1992Mar18.171632.1@cc.curtin.edu.au>
Source record: 224595

Can anyone give me any help with the TurboAssembler package? The main problems is the fact that the docs are in German (which I don't read) and the RSC.PRG program, which seems to be a resource file editor. This is fair enough but it creates files with an extension of .EST (where E is actually Epsilon). I haven't tried to use these files yet, but can anyone give me any info on this file format (if it's different to the .RSC)?

Secondly, are there any English versions available?

Also, I am after any info on resource construction set programs for the ST (free/share ware). Finally, on a different note, can anyone tell me where Sozobon C v2.x is available from?

Thanks in advance.
Pat.

PS: I do have FTP so that's no worries.

>blast! The graphics may not be state of the art, but gameplay is great

Yeah! And did you try 'Revenge of the Mutant Camels'?? I'd say an equal
experience. More megablasting! More insane samples! More shareware!

Also, Minter is working on another game, which is supposed to be even more
cruel than Llamatron which is already high up the foaming mouth scale. We
need more games like these!!

My Llamatron highscore is 1,200,000 or something, getting to level 80 or so
and I do 50,000,000 on Revenge. Just try and beat that! (forgive my childish
attitude here, I get carried away easily)

The Mega STE and the TT have these LAN ports. The Atari blurb says that this should allow you to connect these machines to networks like Appletalk and presumably TOPS too. Atari must have tested these ports with their own and other manufacturers hardware. So where is the software? Does any MSTE or TT owner have it. If not, why not? You'd think that like Apple, Atari would be supplying the software with every machine sold.

Come to that, what does a TT come with by way of software anyway?

>
For the european netters:
These new versions are now also available from archive.cs.ruu.nl.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get the new versions via anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
File: ATARI-ST/cli/tcsh.zoo
ATARI-ST/mint/mntinc19.zoo
ATARI-ST/mint/mntlib19.zoo
ATARI-ST/mint/mntolb19.zoo

--> How to get the new versions via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.
** PLEASE USE VALID DOMAIN ADDRESSES. DO NOT USE ADDRESSES **
** WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET **

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!hp4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/cli/tcsh.zoo
send ATARI-ST/mint/mntinc19.zoo
send ATARI-ST/mint/mntlib19.zoo
send ATARI-ST/mint/mntolb19.zoo
end

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

A VDI driver is a normal GEMDOS program with a VDI trap dispatcher at the start of the text segment (see "Atari Profibuch ST-STE-TT" or "Het complete Atari profiboek" (?)). If you are registered developer, you can get a driver development kit from Atari.

Source record: 224504

Recently I saw few New Zeeland (sp?) people complaining about a UK version
of the TOS, as they were that expensive when buying in the UK.

Maybe the following is a help for you:

You can get both the Dutch TOS and the UK TOS in the Netherlands!
That was true for at least TOS 1.04, so I think this is true for
2.06 as well. Our keyboards equals the UK keyboards.

I donot know about prices, but I saw adds which includes the thing
to build 2.06 in a normal ST for surely less than 200 guldens (160?).
So, a US dollar is about 1.90 gulden...

I cannot help you purchasing one, but maybe some other people on the net.

> desktop, but I have cross-linked clusters, and I'm nervous about fixing them.
> Does anyone have any ideas about reasonably harmless ways to fix cross-linked
> clusters? Thanks.

You did WHAT ? That way you may have got rid of the directory entry, but
did you free the clusters taken up by the folder ?

For cross-linked clusters a reasonable (but not necessarily harmless) way
is to find the files affected and duplicate the cross-linked clusters,
like this:

BEFORE:

```
FILE.1 --> A --> B -+> C --> D --> E
|
FILE.2 --> A --> B -/
```

AFTER:

```
FILE.1 --> A --> B --> C --> D --> E

FILE.2 --> A --> B --> X --> Y --> Z
```

where X, Y and Z are newly-allocated clusters containing copies
of C, D, and E.

That way, you can look at both files and decide which one you want to junk.

Now, *I* wouldn't do such a thing by hand and *I* wouldn't rely even on this
posting. You have been warned ...

Jens.

Greetings...

Anybody have any idea as to what I can do to get a good printer dump on
my new STe?
I have been using a DEGAS driver (prtinstl.lzh on a.a.u.e) with the EPSON.PRT
info file (yes, it's been renamed DEGAS.PRT) on my 520ST for some time
now with excellent results, but on the STe it just gives a really small
output (takes up a quarter sheet of paper.)
I also tried hc24_hc12.lzh (or is it hc12_h24.lzh?) which works on the ST
but it puts out garbage on the STe.
The printer supports Epson LQ800 emulation, the system is a 520STe with
2 meg RAM with CACHEXXX.PRG running, no hard drive.
Any help would be appreciated. Thanks.

Victor Bruhn

I know of at least four glossy and serious German mags, and they're all pretty good as far as I can tell. When ever I pop into Germany I buy a whole load of them. Its quite amazing to see the difference between the UK glossy mags and the German ones. Whereas the UK mags (eg ST User + ST Format) are written for the teenager market the German mags are solid user and programmer orientated. Even if you can't read the text the programs are perfectly readable, plenty of C, Pascal, Modula-2 and Basic. ST Computer for example runs to 200 pages every month and only two of those pages are given over to games.

Our German friends would be better qualified to discuss these matters than me though.

Yes, I did see it, because I attended the Atari press conference. It wasn't shown to the public, though.

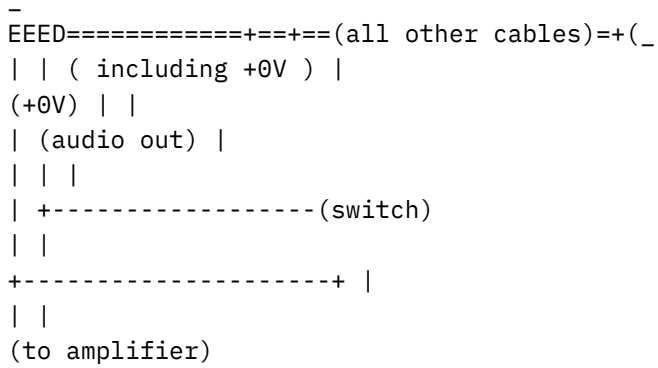
From: aeg03@rrz.uni-koeln.de
Message-ID: <1992Mar18.134914.123375@rrz.uni-koeln.de>
Source record: 224509

Newsgroups: comp.sys.atari.st
Distribution: comp.sys.atari.st
Subject: Problems getting ST sound to HiFi components
Keywords: St sound, monitor, audio out, NoiseTracker

Hi netters,

I'm trying to get the sound from my Atari 520 STfm to my tape recorder. To do this, I assembled the following:



I plugged the plug into my ST and the plug from my monitor into the socket. My goal was to be able to direct the sound output either to the monitor speaker or to the ampli, whereas all signals for the video were supposed to be left untouched.
The sound was somewhat distorted by scratching and humming noise, but seemed to work basically. However, the video signals seem to be distorted too. Small white pixels flicker around on the color monitor and when I touched the screen once, the picture started to flicker like mad and finally disappeared completely. The flickering obviously was caused by the cracking that normally occurs when I touch my screen (because of electrostatic discharges (is that the correct technical term?)). Fortunately, no permanent damage was done,I merely had to switch everything off and on again.
I think that there is a problem with the shielding of the whole thing, which I fitted into a plastic box with a metal base, but I have no idea how to fix it. As you might suspect by now, I don't have much experience with such stuff. Please tell me what you think is wrong.

Thanx in advance

2727. MiNT and file-locking

Newsgroup: comp.sys.atari.st
Date: 1992-03-18 14:15:13 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <1992Mar18.141513.5700@unibi.uni-bielefeld.de>
Source record: 224513

Hi there!

I've got a problem with Mint and it's this one:

Since MiNT is a multitasking system, it must contain a file locking service
and it obviously does, because it installs the _FLK cookie.
But when I try to call Gemdos 92 - which is as far as I am informed - the
function call for Flock, I do get nothing but errors, and, not perhaps
errors like -58 Elocked or -59 Enslock, but error -32 Invalid function
number!
So is my information about the Flock call incorrect, or does MiNT use a
completely different call?!?!?!?

Any answers would be appreciated!

> The second line is *not* necessary; it just shows how one can redefine
> or add key-bindings.

Paul> erm, whats the switchs for?
Paul> -m == modify keymap yeah?

The switchs tell gulam which keyboard table should be modified: -r =
regular buffer, -m = mini-buffer, and -g = gulam ue buffer. Gulam
outside of ue is in the min-buffer.

Paul> And how do I determine which control sequence equals what code?

Well, the gulam help file is a start. I read it to do the above!
Don't remember anymore how.

I just picked up the March issue of AIM at my local BookStar
(a _great_ bookstore) and saw an advertisement for the
TOS Extension Card from CodeHead Technologies. (Please note:
I'm not an employee of theirs, it's just since everybody's been
wanting this info, I'd thought I'd post)

Here is the scoop: (a quote from the ad)

"The TEC is a tiny card that fits in any model of ST computer,
regardless of design. It works with existing upgrades, like
MS-DOS emulators or hardware accelerators. If you have a Mega
ST, or an ST with a socketed 68000, you can choose one of the
solderless plug-in versions. You can even flip a switch and
return to an older TOS, to run software that's incompatible
with TOS 2.06. And the low price of $139 includes the ROM chips!"

So, try contacting CodeHead for more info.

Thanks for the reply! I guess you're aware of some of the problems we've had since the RAM shortage begat the ST shortage which begat the Atari marketing focusing on Europe. It's nice to find out that in a perfect supply/market environment the ST is viable. Seems like the market here (USA) has become a MSDOS monolith since RAM fiasco. There's only two players left that have real influence IBM & Apple with the Mac. 'course people will still argue that the German market should've been sacrificed in favor of the USA, but I can't really argue that position myself. Bird in the hand vs two in the bush.

>Let's get our facts straight... I've heard between 12 and 16 Megs but
>128 Megs seems outrageous.

hehehe! Actually, it would be rather STUPID for Atari to limit a machine to 12 - 16megs [not that they don't have a reputation for it already, as the original STfm SHOULD have been able to be expandable to NEAR that if it weren't for engineering short-sightedness. The lowly 68000 is capable of a 16megabyte address range.. The 68030 is capable of 4 gigabytes architecturely. With all the workstations with 16-32megs, why not support 128megs?? [128megs outrageous!? haha! By the time Atari actually gets around to shipping this.....]

Does anyone have GCC running on a 1040ST, with a hard disk?
I have the env variables set properly, in gulam, and nothing
extraneous loaded (not even a ram disk!) and I keep getting
"exit 1" on hello.c, the classic "Hello World" program.

I'm missing something -- but the docs, such as they are, are
not even with the gcc or the g++ package at atari.archive!!!
I found them off in a utilbin zoo archive somewhere!

What is a .olb file, anyway? It isn't documented anywhere -- it is
like a .a library in UNIX? Will gcc-ar handle it? Does it need
unpacking?

Scott

While Atari ST's CAN read PC format disks this ability is *NOT* limited to TOS versions 1.4 or above, as stated in newsgroup...I know this since my humble and still fully functioning 1985 ST (that came with a single sided EXTERNAL drive and little else) running on TOS 1.0 will read PC format disks also!!!

By the way, I'd love to hear from others who still have an antique such as the machine I have, I sometimes feel, amidst the tech-talk of TT's, ST-BOOK's etc. that I'm the only person left with a pre-internal drive machine!

IS THERE ANYONE ELSE OUT THERE...ANYWHERE...WITH TOS 1.0

These are how BAD RUMORS start. How much is it expandable up to?

Let's get our facts straight... I've heard between 12 and 16 Megs but
128 Megs seems outrageous.

heidelj@alleg.edu, 17.03.92:

>You could rotate and twist any frame you want any degree you want.

But not with Timeworks 2.0! It was very disappointing for me to hear this on CEBIT. It should have been no problem for the programmers to implement text rotating - because VDI supports it! And, using FSMGDOS, you could even rotate text by any degree - not just in steps of 90 degree.

Perhaps they will implement rotating if some mags report on it... :-)

Regards,
Patrick

I think the best magazine is ST Magazine. It contains the right amount
of everything and it's not very expensive (France: 28 F, Belgique 200FB
Canada 7.95$C, Suisse 8.50FS) Here it is a overview of the February 92
issue:

Pages Article
------ ------------------------------------
06-15 News (FSMGDOS, ST BOOK, AHDI 5.0, METADOS, 1040STE PLUS...
20-23 Article from David Small concerning WAACE 91
24-28 Readers Mail (Questions & Answers)
30-33 ST Initiation Part 1 (For Beginners)
34-37 Review: Avant Vektor-Plot v1.2
38-39 Review: La Cuisine (French recipes program)
40-41 Review: Photolab F/X
42-45 Review: NVDI v2.01
46-48 Review: Matrix/Matgraph (Graphics Boards)
50-53 Programming: Starting in C Part 2
54-55 Hardware: Building ROMs for cartridge port including schematics
and board layout (4 EPROMs 27256 or 2 EPROMs 27512)
56-59 Programming: Exceptions of the 68030
60-61 Erratum: Mistakes on last issue :-(
62-66 Programming: Advanced GFA Basic Part 3 (Sprites, scrolling...)
68-71 Programming: Scrolling on the STE
72-74 Programming: Printing Graphics part 2 (9 pin printers)
76-78 Programming: Fractal Mountains part 1 (GFA Basic)
80-82 Hardware: EPROM Programmers
84-89 Programming: Redraws, Resources and others
90-93 Programming: GFA Basic errors reporting by your program
94-98 Programming: RSRC_GADDR & RSRC_SADDR
100-103 Programming: MEGASTE 8/16 Mhz and cache (Assembler)
106-107 Dossier: Connection in serie
108-109 Dossier: Modems, Minitel & Telecommunications
110-111 Dossier: Disquette and Hard Disks
112-113 Dossier: Text (CR/LF, CR, ASCII)
114 Dossier: Images
116-119 Buy & Sell, Contacts...
120-122 Review: Daata Sound
124-127 PD
128-130 Review: Mister Jam
132-133 Demo Reviews: Punish Your Machine, Just Buggin' Demo
134-135 Interview: Unlimited Matricks (ULM)
136 Interview: The Respectables
140-141 Review: Microprose Golf
142 Review: Populous World Editor

143 Review: Lethal Xcess
144-145 Review: Powermonger Data Disk: World War I Edition

The magazine is 148 pages and every issue is packed full of information.
I would like to know if there is any other magazine that compares to it.

>Well, I hope it runs on my TT...

It definately works on the TT, but I have a poor memory of the various
env variables required. Something like this:

1. GCCEXEC = E:/gcc/bin/gcc-
2. GXXINC = e:/gcc/inclide/g++
3. GNUINC = e:/gcc/include/gcc
4. GXXLIB = e:/gcc/lib/g++
5. GNULIB = e:/gcc/lib/gcc

I hope that's all... it'll at least give you a start.

Hi all,

Thanks for all your help, but finnaly, david10@garfield.cs.mun.ca
gave me the best answer!

if you edit the first 6 hex digits of your bootsector from:

Standard ST TOS 1.0: 000000

to:

MS-DOS 3.2/3.3 : EB3490

Your disks will be able to be read by an IBM.

Yours truly,

>128 Megs seems outrageous.

Not real, if you can afford the price, the Mac IIci, IIfx and Quadra 900 can take 16MB SIMMs and with 8 SIMM sockets that's 128MB. Then of course those Mac cost lot more then $1200 even in most striped down form with education discount . 12 and 14 is a little odd though, since 030 is 32bits wide, one would expect a 32bits wide memory access to gain the speed which would mean 4 SIMMs for a bank, so 12 and 16 means 3 and 4 banks but 14MB? unless they choose to use 16 bits wide like the Mac Classic II which hampered its performance. Also 3 banks of 4 socket would take quit some board space, if they designed to take 4MB SIMMs then 16MB only needs 1 bank of 4 sockets.

We just have to wait it's offical announcement to know what they have done to it, before then, it just rumor and could change anytime. If Atari did get it out this year then would be great.

Me too about it's availability in the UK. I have had an ST since 1985
and would _really_ like this pack (price permitting of course).

I have _not_ phoned Atari UK yet (not till next week) but I have a
funny feeling that they won't know about it and will want to
provide me with the old pack (the one with the C compiler and
Atari RCS etc).

>ROMs. The Atari guy I spoke had to avoid that it bases on Eric Smith's work,
>they only added the GEM surface. He said that the development now will be
>continued on Atari side and will surely make another way than Eric's MiNT.

What do you mean, had to avoid that it's based on MiNT? If the Atari guy
gave you that impression, he clearly didn't know their own demonstration.
At the MultiTOS demonstration I attended the moderator clearly stated that
(I try to cite):

"... MultiTOS is based on Mint, for those in the audience who've heard of
MiNT before ..."

So, I guess Atari stands to the fact that they used Mint as a basis for
MultiTOS and there's nothing to avoid, really. Of course, Atari's MultiTOS
will now take a different direction than Mint. That is always the case when
a vendor bases a product on another, already existing program. The only
possibilty for this not to happen would be if Eric Smith became product
manager for MultiTOS, i.e. started to work for Atari.

Just my $0.02 worth on the subject.

So long,
Martin

PIET>>Is this a full version or a demo (crippled) version?
PIET>>
PIET>>Can you use it without the documentation, or is the doc available separately?

It does seem to be a full version. You can use it without the documentation,
but they offer the documentation for 10 quid, and I shall probably buy it.

COMPO also offer the other add-ons that they make:

Canon BJ10 driver
Screen fonts for the built in fonts of a HP Deskjet 500
C-Font (a Calamus to GEM font converter).
Other bits and pieces that I can't remember off-hand.

In the past, I have only written boring stuff (letters, unimportant
documents) on the ST using FirstWord+. Anything more complex, I've done on
the Mac or using LaTeX. WriteOn seems to allow you to do the multiple font,
multiple font size stuff that you need for more complex documents (without
mixing too many on a page, of course...).

Cheers,

Chris Price.

PS. Having now read what was worth reading of this months ST Format, they
promise more real software free next month. I can't wait!

> Does this seem right? Isn't there a cheaper way?
You will have to lose at least 512K on the main board winding
up with a 2.5 Meg machine. Not all memory expansions use SIMMS.
Zubair's board can be got for around $100 now. If you remove all
mother board chips you can go to 4 meg.

Subject: Re: "Multi-tasking" software
References: <4Zy9gB3w164w@cyberden.uucp>

In response to BIll's questions regarding Multitasking, There was once
such a program, called MTOS. I purchased a version of this ages ago, I think
1986 or so. You could Multitask BASIC programs and some ML, but it was
very limited as to how large your programs could be, and other stuff as well.
It didn't work very well, even BASIC multitasking was so-so, which I guess
is why it didn't really take off as an 8 bit product. I really don't see too
much need for multitasking on the 8 bit atari. It was never meant to do that,
and you need memory management and relocatable code to really do it properly.
These are two things the 6502 can't do extremely well. With the expanded
instruction set of the 65816, relocatability at least becomes highly feasible,
and Dataque's Turbo-OS which comes with his Turbo816 card has some rudimentary
memory management routines built-in. Still, I would much rather prefer some
task switching as opposed to multitasking. I don't need to dearc while
downloading. If you want to dearc a file while online, you can quit
Bobterm, run UNARC, and then return to Bobterm and you will still be online.
DeARCING is meant to be an offline process in my opinion. There is a
task switching program as well, but only the most behaved programs seem to
work with it. I don't currently use it, as I am Sparta X user, where the
words "well behaved" just don't seem to apply to most of it's internals.
With a RAMDISK, task switching is almost achieved. When I was running
my system with a 9 pin printer, jumping back and forth between Daisy Dot III
and Textpro was almost instantaneous, especially when the document was kept
in Bank 1 or 2, as they were always there, even when you left the
word processing program. The only thing that could have topped it was
a program to just tell DDIII to look into Textpro's buffer space for the
code, instead of loading it off of the RAMDISK.

Just my ramblings.

Thats just such a cool idea that nobody probably thought of it.

They probably took the modern attitude "Oh, it'll be obsolete tomorrow and noone will want to read it again". This may be true for the vasy majority of junk in todays magazines, but some of the priceless information in the old ST worlds is awseome.

For example, I had a problem with argv only the other day. For some reason Pexec() was only passing a few characters to child programs in the command line. Much perplexed I turned to the old ST Worlds, and there in one of the amazing 'programmers clinics' I found a small conversation between, I think it was Mathew Lodge and Les Kneeling, or Lloyd Patterson, regarding Pexec, and saw that the first byte of the command tail actually tells Pexec how long the command tail is. I had thought that the first byte was ignored, and so used a dummy space, thus restricting my effective command tail to CHR$(" ") characters.
A quick poke of the value 127 into the first byte, and lo, a usable command tail. For some reason, values over 127 confuse my compiler.

But I digress!

ST World even gave quite a lot of coverage to UseNet a few years ago, and showed a screenshot of article 544 in comp.sys.atari.st :-)

Is Steve Cassidy out there? He used to write for St World, and maybe he could tell us what the copyright situation is. I would be happy to type out a few articles in my spare time and post them (exams permitting) if I was given permission by the copyright people.

I have all issues of ST World from Nov 88. :-) :-) :-)

Adverts for 520STFMs at the incredible price of 600 quid !!!!!

Oh, by the way, I think that the 'programmers clinic' sections, were the inspiration for many of the cover disk programs of recent months.... I have a complete source code for a program called 'Post Mortem'. Need I say more? Pure speculation of course ;-)

ST World leads the field yet again.

One more time... I have nothing to do with either ST world, or any other magazine.

Just a reader who knows quality when he sees it.

Is there any software for it yet? (Anyone for an X25 network using
synchronous serial lines? :-))

>
>Come to that, what does a TT come with by way of software anyway?

I can only say what came with my TT, not a lot!

The "Language Disk" had a demo program (which just opened a GEM window with
an Atari symbol filled oval in it) and an Auto directory containing AHDI +
all the AHDI boot-time support files. It also had the extensible control
panel. Note: there was no "Language" on this disk at all!

The "Advanced Hard Disk Utilities Disk" which only had the AHDI installation
programs on it, no cacheXXX.prg or folderX.prg (as mentioned in the TT
manual).

Yeah. This is a full, uncut commercial version.
With a manual, and a largish section in the magazine to start you off.

The cover disks are definitly sometimes worth looking into.

For example, I have got off of cover disks...
All these are complete commercial versions...

1) Complete version of HiSoft Devpac Version 1 (Now I have version II)
(ST/Amiga Format [as it was then] OR ST Format)

2) The game 'Interphase'. (ST Format)
3) TCB tracker. Complete version (Atari ST User)
4) Write ON. (My father has the original anyway).
5) Next month, hopefully Harlekin 1 (St User).

There are probably more.

2774. Pagestream Crashing

Newsgroup: comp.sys.atari.st
Date: 1992-03-19 15:36:01 UTC
From: psurge@cs.utexas.edu
Message-ID: <kshd71INNcqm@sahara.cs.utexas.edu>
Source record: 224462

I have ftp'ed the clipart files from a.a and "unzoo'ed" them. However, when I try to load one of these into Pagestream (v1.8), the machine crashes.

I am using a stock 1040 stf 1 meg memory running from a hard drive (icd controller). I have not really had any problems running or doing anything else, except using Helvetic fonts (which also crashes).

Is it just v1.8 that does this? What advantages do I have to switch to the newer version (2.1, I think).

Thanks in advance

>posting. You have been warned ...

The original poster is right to be nervous about cross-linked
clusters, as the "BEFORE" diagram above make clear. Suppose FILE.1 is
inspected and appears to be good but that FILE.2 is determined to be
bad. A natural thing to do is to delete FILE.2. But if that is done,

then blocks C, D, and E are freed, which will cause FILE.1 to
"mysteriously" go bad.

Unless you have good disk repair software, the safest thing is to copy
off all of the files you can onto floppies and rebuild the partition.

From: heidelj@alleg.edu
Message-ID: <1992Mar19.155415.4154@pellns.alleg.edu>
Source record: 224468

Help!!!! I just tried installing Spectre GCR on to my last partition on my hard drive which had/has nothing on it. I formatted the last partition to GCR format, the computer rebooted and now I can't access anything on my hard drive though I know it is still there. I loaded Spectre back up to tried and look at the format menu. It still knows that I have all of the partitions but I can't access it. Is there any way to reformat the last partition back to ST format and how can I access the HD again?

Thanks,
Jason Heideloff

>The printer is not the limiting speed factor - Calamus pauses for recalculation

Calamus seems to be the exception. I have tried printing from pagestream
with their driver and from gdos programs with a gdos driver from
"Working Title" in England. In both cases, fairly simple pages take
12 min to print (I don't think it depends on complexity). Thus
the bj10e is completely useless to me as a high-res printer. I use it
for printing ascii text files and for screen dumps. For high res, I
print on a remote LaserWriter and run the stairs for output.

Has anyone been able to get PCDITTO to print to the SLM804 laser printer?

What I've tried so far:

* Start up the Diablo emulator for the laser printer; then
start pcditto. When trying to print (from TurboTax, if
it matters, telling it that I have a DIABLO630 printer
attached), I get some sort of printer-not-responding error.

* Ditto, with laserbrain epson emulator.

The only thing I've been able to get to work is to have TurboTax
print a Diablo print file *to disk*, exit back to the Atari desktop
and print the file from there (with the Diablo emulator installed
of course). This works about 95%... some of the pages come out
half blacked out... (I called the turbotax folks and unfortunately
they don't have any postscript printer drivers... that plus ultrascript
would print out some really nice tax forms...)

So the generic question is: is there some voodoo I can work either
with the diablo emulator, the epson laserbrain emulator, and/or
pcditto I that will let me print?

Thanks...

2785. ST Virtual Reality S/W sighted!

Newsgroup: comp.sys.atari.st
Date: 1992-03-19 19:17:09 UTC
From: bill@mwca.UUCP
Message-ID: <1973@mwca.UUCP>
Source record: 224415

Yesterday I saw an interesting looking package for the ST from Domark, something like "3D Construction Kit". It claims to let you build 3D objects (cars, houses, etc.) and then very easily manipulate the universe you've created, such as walking inside the house, having the car drive down the street, etc. It also said the package is suitable for games, as it includes an "engine" to make use of the objects you create. The software was about $80, and had some impressive looking screen shots.

I saw a paragraph about this product being released for PC's, but had no idea it was available for the ST. Has anyone used it or seen it? It looked quite intriguing - nothing you couldn't do with CAD 3D, but probably much less effort to produce and manipulate objects.

There seems to be a fair amount of confusion about this whole
topic, based on what I've seen discussed rectntly. All TOS
versions can READ PC format disks, but only TOS 1.4 (and
above) can format a disk so that a PC can read it.

>
>Am I the only one who worries about dates?

I think you're being bitten by a bug in TOS versions prior to TOS 1.04
(aka TOS 1.4)...

Setting a file's date/timestamp doesn't work correctly in most cases
with these TOS versions!
(It CAN be done, however - Fopen() a file, then use Fdatime(), then
immediately Fclose() it again!)

The programmer of your version of LHarc may simply be unaware of this
problem.

I don't know if there is a fix for this (except getting a newer TOS
version...;-))

Bye

Heehee, I had the same reaction. I think Jens needs to get a copy of
CleanupST (ICD software, very very nice), or even the PD fsck on atari.archive.
I used the PD fsck for a long time, and it seems to work fine for me (Mega2,
ICD host adaptor, Seagate ST296n, TOS 1.2).

Probably not. The version of ICD software I have allocates extra memory for
folders at bootup (you can select how much). Check out your manual, and if
you don't have this feature, you should download the latest ICD stuff from
their board (or maybe from atari.archive, if it is there).

I got to see a beta version of Flash II at the Chicago Show the weekend
before Thanksgiving Holiday.

I wasn't impressed all that much actually. However, if any of you can
remember way back. The MOST promising terminal program I think was
ST-Talk?? So long ago, I can't remember. A friend of mine bought a copy
but it was as buggy as hell, not very useful. But, wow, PERFECT VT220
emulation. It also supported color.

It never got upgraded...a truly massive piece of software though, 250 K for
a terminal program!!! Goodness!

I think it was Timothy Purves that was working on it. I got to talk with him
at the show in Detroit where we bought the copy. HE LOOKED TIRED.

We talked about event management, problems with the NEW TOS...1.2 at that time.

Anyone have a copyof this program. It had everything but the kitchen sink.

I was wondering: Which issue is it that has Write On? I was in at my
local Atari establishment today, and they had Jan and March '92. Neither of
which contained Write On. Should I look further to find February? (March's
"feature" was Minter's "Revenge of the Mutant Camels", definitely a good
game, but not needed, since I've already registered. I won't bother "boasting"
about my low-scores!) Or is Write-On in the April issue (Time warp time!)?

>I gues this should have a UK distribution, but I thought the rest of you
>wqould be interested in what you are missing.

No, I actually DO appreciate hearing about it, because us colonials don't
ALWAYS miss these things - I've actually seen ST Format on some fairly
ordinary newsstands here in Ottawa, Canada!

This sounds kind of like the late days of STart Magazine. For a few months,
they had some pretty decent commercial software on the disks-of-the-month.
Then they went out of business... Hopefully that won't happen here!

From: d9fors@dtek.chalmers.se
Message-ID: <10292@chalmers.se>
Source record: 224405

I noticed something very annoying yesterday!!
When I switch resolution I loose memory.
Whith no memory resident programs (Autos or Accessories) I loose
17-18 (17.5?) kb of ram when I switch resolution.
Accessories will make the problem even worse since the memory used
for the accesories will be lost every time to.
That is if I have accesories that take up 82 kb of the memory I will
loose 100kb every time I change resolution and eventually I will not
have any left.

My question to you out there is if this happens to you too.
I have a STe with TOS 1.62 (Swedish).
My old ST with TOS 1.2(Swedish) don't have this problem.

This is actually a fairly old product that was (is?) produced in Europe.
I had a demo version of it from a UK disk mag circa 1990. It was
developed using the same system Domark used for the "VR" game
Castlemaster.

IMHO, after seeing the demo, I didn't find it terribly exciting. The
graphics were kind of weak and cruising around a 3D polygon
yard and building becomes exceedingly boring after about the first 30
seconds.

Bill> I saw a paragraph about this product being released for PC's, but
Bill> had no idea it was available for the ST.

You're thinking of their "Virtual Reality Construction Kit". I
think this is a newer/better 3DCK and to my knowledge is only being
supported on the PC and Amiga.

Bill> It looked quite intriguing - nothing you couldn't do
Bill> with CAD 3D, but probably much less effort to produce and
Bill> manipulate objects.

3DCK lets you create an interactive environment with a kind of
customized user interface, CAD 3D couldn't do this without a whole bunch
of custom software. That's really the whole point of 3DCK.

2804. >> SITE LISTING FOR ATARI SOFTWARE <<

Newsgroup: comp.sys.atari.st
Date: 1992-03-20 10:00:46 UTC
From: woocm@essex.ac.uk
Message-ID: <2573@sersun1.essex.ac.uk>
Source record: 224430

Atari Users,

One of the most FAQ's is a list of sites for atari software
and most responses just list a series of internet addresses. Well
i thought how about a more informative posting.

This list is just a temporary list, in a couple of weeks i
shall add details of the major software at each site and addresses
of mail servers. Hopefully producing a complete listing of when and
where, and how to get your atari software.

This list was initially started by using the archie database
and BITFTP to chaeck the directory's and get a basic look at the
software on offer. Obviously archie doesn't know every site, well
lets face it atari.archive wasn't on it!! So if anyone else woul;d
like to inform me of any other sites for inclusion, just the
address will do i'll do the rest, i'll pop it in and update it
as oftern as possible. Come to think of it twitterpatter is one
already that isn't in here, you have to wait a couple of weeks
until i get it sorted.

Anyway this is a little teaser to get you started. These
sites are all in my opinion good, and definitely worth checking
out. I shall enhance and revise and repost in a week or so if
all goes well, Hopefully with the (almost) complete picture! :-)
ENJOY.

Chris Wood. (woocm@essex.ac.uk)

I have TOS 1.2 and I don't think there is *ANY* indication at that from the
desktop - very bad.

I think you have 'Lost cluster' not cross-linked ones.

Lost clusters are ones (in a chain) that don't have a directory entry connecting them to a file (or directory) - there 'lost'.

Crossed cluster are where you have 2 directory entries using the same chain (in the FAT) or part of it.

Anyway you're happy about loosing the directory (+contents) so try running 'fschk' - I wrote the whole of the root dir with 0's on one partition after a crash with 're-org' and this cleaned up the fat nicely.

Generally it would have been nicer to search for the ACTUAL address of the directory and reset the directory entrys cluster pointer to be where it should, but anyway try fschk and see what happens.

Dom De Vitto, ddv@uk.ac.bton.unix

(but don't sue me if it all goes wrong - mail me for advice first at least!)

^^^^^^^^^^^^^^^^^^

This problem was solved some time ago. There are boards now containing
2 Megs and a smart GAL which hooks the two .5M banks together, thus
yielding the full 3 MB. These boards are quite cheap also (about 300DM)
but require quite a bit of soldering.

>up with a 2.5 Meg machine. Not all memory expansions use SIMMS.

I have it.

Its pretty good... basically just create an object, resize it with obvious
buttons, and place it. Each object can be colored individually, with a whole
load of colors, some stippled, some solid. There is also a simple language
to allow you to create games and animations.

Recommended.

I built a model of my girlfriends house with it, and gave her a guided tour.
She was quite impressed...

Basically, it is possible to tell the TOS version from the years that
appear in the copyright info when clicking on the "about" in the DESK
menu:
1985 -> TOS 1.0
1986, 1987 -> TOS 1.02
1985, 86, 87, 88, 89 -> TOS 1.04
..... 1991 -> TOS 2.06

At least, these are the numbers known to me. Please correct me if I'm wrong

I bought "Fiendish Freddy's Big Top O' Fun" from someone off the net. The program is unprotected and includes instructions on how to install it on the hard disk - but when I attempt to do this one of the files cannot be copied due to 2 bad sectors. Does anybody have this program? If so I need the file:

Disk 3 : S\JBOWL.4B

so I can "repair" the disk.

Thanks,
Bob Malay

Hi !

I had the same problem while installing Spectre... the solution was to
reinstall an executable root-sector on my harddisk.. after this both the
ST and the "MAC" were able to access the disk.

Hello,
I've just one remaining question about the Crack Art drawing
program:

has anybody succeeded in loading fonts and using them ?
(this is in the TEXT function parameters)...
if any, I'd like to hear from him...

(I wonder if GDOS -- or equivalent -- should be there or not ?)

Thanks for any answer.

2817. Falcon '030 vs 68030 SST

Newsgroup: comp.sys.atari.st
Date: 1992-03-20 14:59:04 UTC
From: malay@sae.com
Message-ID: <1992Mar20.145904.22128@sae.com>
Source record: 224262

Rhetorical question: why would somebody be interested in the 68030 SST or the TinyTurbo '030 at $599 when the new Falcon is rumored to be priced very nicely?? Will an SST-upgraded ST running Tos 2.06 be "better" than the new Falcon machine? Looks like to me the '030 add-on industry is going to be short-lived - just my opinion.

Bob Malay

PS Maybe Fast Technology and/or David Small ought to lower their prices - 1040STe at $380 + '030 upgrade $600 + Tos 2.06 upgrade $60 + additional memory + plus all the "cutting and pasting" - the Falcon sure looks a lot easier to deal with!

Oh, yeah, there are still a few of us around. I run a 1986 STm. No internal drive, but it's got a RF Modulator! (Whoppie.) No internal clock, so I ran DeskCart! until the battery died last summer. Now I have the computer read the Supra Hard Drive's clock. Oh, yeah, TOS 1.0. Ye Olde Standard. Heck, I'm even running my original Atari Mouse! (See guys, they do last sometimes.)

'Course the whole darn system is _badly_ in need of a bath. You can tell what keys I use most often from the lack of grime on them. One of these days I'll clean it. Probably when I get a TT or something.

A company called 'MissionWare' is developing it. It's not on the market yet, but is expected soon. Here's something about it from GEnie:

Category 8, Topic 2
Message 122 Mon Mar 09, 1992
J.TRAUTSCHOL [jtrautschold] at 21:50 EST

Well, maybe it's time to post a list of Flash II features. We're within a month of release now. The plans are to offer it for sale for the first tim at the Toronto Atari Show, April 4 & 5th. Quite honestly, we've been so busy getting everything ready, I haven't had the time to put together a list of Flash II's features. So, here we go. Mind you, this isn't an official press release (that'll come later). Here we go...

* DO scripts are enhanced. Old script files continue to work with new features added for support of Flash II's new features.

* DO scripts are no longer needed, however, for automating your logon process. All board parameters are now set via dialogs. These parameters are saved in the board configuration file and automatically configure Flash II when the board is activated.

* Now permits the use of up to 30 function key macros. 10 macros are considered global, and are accessed by holding down the Control key and F1 thru F10 keys. The other 20 macros can be programmed separately for each board and are accessed with the unshifted and shifted function keys. The macros automatically load when the board is activated.

* Flash II can be used to display, either on- or off-line RLE and GIF pictures. (Particularly handy on CIS which permits the use of online graphics viewing.)

* Includes a new Review Mode. Save your online session to disk and later review it as if you were online!

* Supports the following terminal emulations: TTY, VIDTEX, VT52, ANSI, VT100, VT101, VT102, VT200, VT300 & Prestel.

* Supports ST, IBM and DEC characters sets.

* Flash II is designed to work on any ST or TT, in any resolution, from 80 to 132 columns, and 24, 29 or 48 lines.

* A new type ahead buffer is included. It supports up to three lines of text which is fully editable using the cursor, delete and backspace keys. The [Return] key and [Enter] key perform different functions, depending on the configuration. One can be used to enter forced carriage returns into your message, the other is used to send the message.

* You can configure the amount of memory you wish Flash II to grab at startup. Older versions of Flash grabbed everything available. With multitasking on the horizon, you don't necessarily want to do that. You can continue to <Free> unwanted memory once in the program.

* Includes command support for an automatic answer mode.

* New, full-featured GEM text editor with more flexible block commands (you can now start and end blocks anywhere in a line), cut & paste commands, search & replace function, paragraph reformatting, user tab settings and page widths, automatic word wrap & text wrap modes, and much more.

* The editor now permits you to select the type of display mode desired. Whereas older version of Flash always displayed carriage returns, you can now turn those on or off, as well as all other control characters.

* Almost all menu functions have keyboard equivalents, such as Alt-L to "Load" a file. Where appropriate, these keyboard equivalents match the terminal mode keyboard equivalents.

* Includes Silent Line, a new background file transfer program (replaces "Shadow").

* Internally supports the following protocols: ASCII, Xmodem, Ymodem, Ymodem-G, Zmodem, Modem7, WXModem, CIS B+, Kermit, SEAlink, and Telesoftware (for Discovery/Prestel systems).

* Includes a new "Statistics" feature. Keeps track of all of your online time and upload/download information, and calculates your fees based on the BBS' rates.

* Includes built-in timing functions. Flash II will
autostart an online session using this timer.

* Includes a totally rewritten, 226 page manual, fully
indexed along with a table on contents. The manual
includes a tutorial, detailed section on all functions
of the program, and a 50-page section explaining (with
examples) the DO script language.

There are a bunch more features too, but this highlights the
majority of them. The program will be sold for the introductory
price of $49.95. (It'll probably go up to $59.95 four to six
months later.) We also plan on offering upgrades to existing
owners. The price will be $30 to upgrade, and you'll have to
send in your original Flash disk in order to qualify. The
upgrade offer will last for a limited time only, and although
that period hasn't been set yet, it'll probably be about 3
months after the official release. Naturally, as upgrades to
Flash II become available, we'll make those available to all
registered users at greatly reduced prices.

Hope that covers it all. (I'm sure this will generate a whole
slew of newquestions now! :-)
John T.

May I recommend the following two items:

1) COMPUTE!'s Technical Reference Guide Vol 1 VDI
Author Sheldon Leemon ISBN 0-87455-093-9
(contains all VDI calls)

2) Fontkit Plus V3.4 Sterling Pounds 19.99
Author Jeremy Hughes
The ST Club, 2 Broadway, Nottingham, NG1 1PS UK
This has a 250 page A5 binder describing in great detail the use of fonts
and conversion programs for the popular wp programs. The Fontkit program
is required for designing and converting fonts, and it allows you to load
and unload drivers.

>- what functions should the driver perform (lines/circles, ...)?
whatever your output device is capable of.

>- what is the structure of a driver?

The VDI driver program is a subroutine.

The driver program is entered with the value of $73 in register d0 this is the
VDI call command, register d1 contains a pointer to a block of 5 longword
pointers (contrl,intin,ptsin,intout and ptsout).
contrl is a table of 16 bit ints.
contrl(0) contains the command to execute (ie v_opnwk opcode 1)
contrl(1) number of points in ptsin
intin(0) Device ID number (defined in the ASSIGN.SYS file)

The driver will have to find the required command and execute it. For
example the v_opnwk command could reset a printer and do a form feed.
It should also return information about the capabilities of the device. As well
as contrl(6) - device handle for the device. (copied from intin(0) perhaps?)

If you write the driver in assembler just compile it and change the file name
to MYDRIVER.SYS or whatever.

If you write the driver in C you will require a startup stub to link with your
C code. ie in LATTICE C the default 16 bit is a short.

```
mydriver(short *contrl, short *intin, short *ptsin,
short *intout,short *ptsout)
{
```

```
/* all the good stuff here */
}
```
The startup stub will have to sort out the pointers and put them on the stack
or whatever your compiler does before calling your routine.

> - how do I force VDI to use my driver?

You will require the GDOS program or something similar (AMCGDOS, NVDI etc)
In the ASSIGN.SYS file include your driver and fonts that the driver requires,

```
; screen drivers are 0 to 10 and reserved by ATARI
; printer drivers 20 to 30
21p NB15.SYS ; the driver for the NB15 printer
GGGG10.FNT
GGGG12.FNT ; fonts the NB15 driver requires
;
22p MYDRIVER.SYS ; the driver for your device
MYDRV10.FNT
MYDRV12.FNT ; fonts for your driver
```

It should be possible to replace an atari screen driver with a driver
for your screen device (ie for ST medium resolution -> 3p MYDRIVER.SYS)
perhaps you could have a SVGA DOS machine connected to the serial port!
All things are possible with a VDI.

I hope this helps, Any inaccuracies are entirely my own no help from ATARI
at all!!!
All corrections welcome.

Sorry, I should have been more precise. It is April's time-warped issue of ST Format that has WriteOn. They always seem to bring these things out quite a long while before, so that they stay on the newsstands for longer.

Aside: several people have rightly bemoaned the demise of ST World. One theory why I died is that not enough of us were interested in real software. Another is that there wasn't enough real ST software to keep a mag going. I think there is some truth in each of those. A third reason it died was that you could never find a copy of it in the shops - ST User seems to be going the same way at the moment (just hope I can find next month's issue with the free copy of Harlekin).

Cheers,

Chris Price

2828. Big screen for MGR/MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-03-20 17:55:07 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Mar20.175507.23316@a.cs.okstate.edu>
Source record: 224420

I'm hoping to set up a 1280x960 mono (or color if it's easy) screen
for MGR. I tried using MONSTER and QuickST but that failed (besides
the screen was to have been virtual...)

Now I'm looking at moniter cards:

card max rez comment $US Mfgr/Imptr
1) ISSAC (I hear) 1024x768 550 Dover
2) ReSolution 1024x768 will do a virtual 1280x960 600 Rio
3) Omnimon ??? ? ?
4) Matrix ??? ? ?
5) Moniterm ??? ? ?
6) CrazyDots ??? 950 Gribnif
7) SST add-on ??? ? Gadgets

Can someone (anyone) add some details to this?
Or maybe a few more cards?
I'd like to be able to use the card for GEM also (when not running MiNT/MGR)
so ST mode compatability is a plus....

jc cummins@a.cs.okstate.edu

Re: ST-Talk Professional 2.0

Yeah, I bought ST-Talk Pro. I does have tons of features, but also a corresponding number of bugs. For one, the VT-100 emulation doesn't work most of the time. Also, the capture buffer likes to drop characters, NOT GOOD for uuencoded files. On the other hand, it has the most complete macro language I've ever seen, you could write a BBS system with it! All in all, though, I'm going to stick with UniTerm. At least it always works...

From: rincewind@discworld.uucp
Message-ID: <H.lJwtROYzBWk@discworld.uucp>
Source record: 224254

No, this would not work. Calamus sends its data directly to the printer port, so you cannot redirect it by catching Bios/Gemdos calls. The only way would be to disassemble the printer driver and modify it to dump the data to a disk file.

2834. New Robugs 1.3

Newsgroup: comp.sys.atari.st
Date: 1992-03-20 20:13:04 UTC
From: cs4gp6am@maccs.dcss.mcmaster.ca
Message-ID: <1992Mar20.201304.27054@maccs.dcss.mcmaster.ca>
Source record: 224445

I've uploaded a new version of my Robugs game to atari.archive.umich.edu.
It is version 1.3 beta and the file is called robugs13.zoo (You will need
zoo 2.1 to "un-zoo" it). I have recieved some positive responses to Robugs
version 1.2 which I released in January so here is the next version :-).

For those of you who haven't heard of it before, its a freeware game I have
been working on for the past year or so. It should run on any ST or TT,
colour or monochrome (though I can't guarentee it). The following is a
brief discription of what it is:

First of all the game is a proto-type. There are lots of things I want to
do with it, including porting it to Microsoft Windows.

The basic concept is to build little robots (called robugs) out of various
components. The components include effectors, detectors and logic gates.
The effectors make the robots move, turn, fire a gun etc. The detectors
naturally detect things such as a bumper with detects when a robot bumps
into something or an enemy radar which detects enemy robots. The logic gates
tie it all together. They include AND, OR, XOR and NOT gates. Everything is
done with binary logic. For example, a detector outputs 1 (true) if it
detects something or 0 (false) if it doesn't. An effector does something if
its input is 1 or nothing if its input is 0.

So detectors provide a robug with the means to sense its surrounding,
effectors provide a means for it to take action
Logic gates provide the logic, or brains of the robug.

The entire game is GEM based and you can do everything with the mouse.
You can build many robots, make many copies of them and let them interact
on a playfield. The robots are also capable of reproducing by themselves.

enjoy...

Could you show me the articles in witch Calamus got BAD reviews??
Anyway, I don't think people should be comparing Calamus with PageStream
and the like. PageStream is a general purpose DTP, easy to use,
inexpansive, and with postscript output. It is intended for home,
and for people who do something else besides DTP. I have seen
PageStream and will probably buy it in a near future, because it is
much easier than Calamus. But future-wise I don't think that you
can even compare them. My father has a small desktop publishing
studio and he uses Calamus, and he just upgrated to Calamus SL.
It has tons of features, its very complex and big, and he loves it.
I think it's like comparing QuarkExpress and PageMaker on the Mac.
If you don't want all the extra features, buy PageStream, if you
want top of the line, buy Calamus (SL).

About Flash 2.0

MissionWare Software is marketing the "upgrade." In fact, Flash 2.0
will debute at the Toronto show in Canada on April 4 & 5th.

Features include:
Xmodem/Ymodem/Zmodem and SEALink and Kermit protocols.
Full Flash DO file compatibility
Independent configuration setting for each "board"
Ability to autodial multiple boards
automatically keep track of online costs for pay services

MissionWare Software can be reached at 354 N.Winston, Palatine, IL
60067 (ph: 708-359-9565).

It is strange that no one ever wrote a program that would just add an MS-DOS-compatible boot sector to any 720K Atari disk. This can be done, even when the disk is already formatted and has data on it!

I know that DC FORMATTER does this, but Double-Click doesn't seem to want to publicize the fact. Perhaps the only hackers left in the ST world are the ones who hate MS-DOS and refuse to have anything to do with it? Or they've all upgraded to TOS 1.4 and no longer care...

I've seen it on the PC (someone else was trying it) and it looked quite OK but
"reality" isn't the word I'd use since the cars could fly and enter the houses
and so on.
There was no real connection between the objects and you could even pass
through a computer in one of the houses.

>text by any degree - not just in steps of 90 degree.

It is my understanding that Timeworks Publisher 2.0 is a clone of the MS-DOS
version, Publish-It 2.0, and so does not support anything that can't be done
on the IBM platform also. It does not support FSMGDOS, at least at present.
I don't know how difficult it would be for them to add this capability in
the future.

There is one advantage though. The ST files are fully compatible with the
MS-DOS version, so DTP work can easily be ported between a PC at work and
an ST at home, templates created for the PC version can be used, etc.

>TinyTurbo '030 at $599 when the new Falcon is rumored to be priced very nicely??

Because if you need the speed, they are available now.

We'll probably be lucky to see the Falcon available for purchase in the year
2000, at a time when every other new computer is boasting a 68090 or whatever.

Presumably the Falcon will also contain Atari's long-awaited CD-ROM drive?
Or perhaps that still won't be ready by the year 2000...

The other day I posted to the .tech group about this, but either most people are on spring break, the .tech newsgroup isn't received everywhere, or I am just plain screwed.

I am hoping not to fall into the last of those categories, so I'll ask again:

A couple of days ago, I had just ftp'd dmjgif, the .gif --> spectrum converter, and was moving a file from d: to e:. I get an alert box that says drive e: doesn't exist. When I open up the directory window for d: the next time, all of the files that used to be in e: now are showing up in d:, and the files that were in d: appear to be gone!

The system auto-booted fine, and my FSMGDOS stuff was on d:, so the files seemed to be intact, but I couldn't access them. Some helpful people suggested I try the ICD accesory and try to shuffle the partitions around. Didn't help. The I used ICDFORMAT to look at the partitions. The d: partition was still there, but it's volume name was gone. I tried to rewrite the partition info, but that didn't help.

I got frustrated and re-formatted and re-partitioned the whole thing. I started to restore the files, when I thought I'd boot FLASH and check my mail. Two bombs. I tried some others. All the executables give two bombs when launched from the desktop. I looked at some of the ascii files, and they appeared to be intact. I erased everything and started over.

Before I began to restore everything, I used the HDUTIL to set up for autoboot off of c:. The .SYS file on c: got written just fine, but it wouldn't boot. At this time I gave up and started writing this plea for help.

Sorry about the long-windedness, but I didn't want to leave out any (potentially important) steps.

Many thanks to those who responded the first time, and many thanks in advance to those who espnd to this,

deskt

As far as I know, you can't use either of the SLM804/605 emulators
(Diablo, Epson) from a software based emulator like PC-Ditto or
Spectre GCR as they kick TOS out of the system when they start up.
When TOS goes, so do any auto programs or DAs. Spectre allows
printing to the SLM with its OWN driver that emulates an imagewriter
(very slow - I'm still waiting for someone to do an Ultrascript to SLM
from within Spectre program). Sounds like your
Diablo-->disk/reboot/print solution is the way to go. With GCR I go
postscript-->disk/reboot/print via Ultrascript.

```
- Yah, its true. There are allready boards for the Amiga that give
- you 32MB, 64MB, or 128MB of RAM. Quite costly however.

Yep. Everyone seems to forget the TT can have 128MEG of FAST-RAM...
It wouldn't make sense for Atari to limit their new computers to less
RAM...

In a previous article, fergus@areaplg2.corp.mot.com (George Fergus) says:

>
>It is strange that no one ever wrote a program that would just add an
>MS-DOS-compatible boot sector to any 720K Atari disk. This can be done,
>even when the disk is already formatted and has data on it!
>
>I know that DC FORMATTER does this, but Double-Click doesn't seem to
>want to publicize the fact. Perhaps the only hackers left in the ST
>world are the ones who hate MS-DOS and refuse to have anything to do
>with it? Or they've all upgraded to TOS 1.4 and no longer care...
>
>-George
>
I noticed I sometimes had trouble with disk that weren't originally
formatted with DC Format.

Just put "EB3490" with a sector editor in the first part of the bootsector.
That will make it readable.

2852. PostScript interpreter (news release)

Newsgroup: comp.sys.atari.st
Date: 1992-03-21 07:56:48 UTC
From: steve@thelake.mn.org
Message-ID: <A253237365@thelake.mn.org>
Source record: 224498

I ran across the following news release. I haven't seen the product.

CompoScript

Goldleaf Publishing, Inc. is proud to announce the arrival of
CompoScript, the state of the art PostScript interpreter for your
Atari ST/TT. CompoScript enables you to print PostScript files on
non-PostScript printers. In addition, a PostScript file can be shown
on the screen and there is an option to convert it to a graphic file,
so that you can subsequently import it into a graphics or DTP program
which does not support PostScript.

If you use DTP, Text, CAD, Graphics, Music Notation or Presentation
software, then you will almost certainly benefit from CompoScript.
Many programs can produce PostScript files, and by using CompoScript
you know you will get the best quality possible, both on screen and
printer. If you use programs on other operating systems, such as
Macintosh, MS-DOS, Amiga, or Windows, you can save your files to disk
and print them with CompoScript, providing flexibility and compatibility.

CompoScript obsoletes other PostScript interpreters with its
amazing features :

Compatibility - high degree of compatibility means no specialized
fonts or customizing your software for the interpreter;

Flexibility - CompoScript can be configured to automatically print
selected files without any user input, and automatically delete
files after printing. It can drive your printer directly or
through the operating system. You may configure memory usage and
the built-in virtual memory, and edit resolution for file
conversion or screen display; even edit screen angle and
frequency for grey scale output!

Typefaces - CompoScript uses hinted PostScript Type 1 fonts, the
highest quality font format available. It includes the standard
35 font set (designed by Bitstream) and not only can these fonts
be used by other applications, but any Type 1 font may be used in
CompoScript as a built-in font, simply by telling CompoScript the
font location! In addition, the entire Bitstream Typeface Library
of Type 1 fonts is available - over 1000 fonts!

Screen Preview - Optionally view your file onscreen, at any
resolution up to 600 dpi. Then press a key to immediately print

the file.

File conversion - Convert PostScript files or clip art to GEM Image (.IMG) or TIFF, popular file formats supported by almost all applications.

Font Control - Define or edit font aliases for printing files with fonts you don't own, or for changing font definitions.

Printer Support - CompoScript supports the following printers :
Atari SLM 804/605 laser printer
Epson, Star, NEC, Panasonic, OKI, Seikosha & compatible
9 & 24 pin printers
Canon BubbleJet and compatible bubble jet printers
HP DeskJet, DeskJet Plus, and DeskJet 500 ink jet printers
HP, Epson, NEC and compatible laser printers

CompoScript supports 360x360 dpi printing, data compression, and unidirectional / bidirectional printing for printers that include these features.

Price - Despite it's incredible feature list, CompoScript has a SRP of only $349.95.

CompoScript runs on any Atari ST/STe/TT with at least one megabyte of memory and a hard disk. For more information, please contact us.

2853. Joppa FAX software

Newsgroup: comp.sys.atari.st
Date: 1992-03-21 08:03:08 UTC
From: steve@thelake.mn.org
Message-ID: <A274995317@thelake.mn.org>
Source record: 224265
Body handling: HTML body converted to readable text

Here's an edited transcript of a GEnie realtime conference (RTC)
about Joppa FAX software for the ST. It's more than 28K, so skip
this now if you're not interested.

==========
(C) 1991 by Atari Corporation, GEnie, and the Atari Roundtables. May be
reprinted only with this notice intact. The Atari Roundtables on GEnie
are *official* information services of Atari Corporation.

To sign up for GEnie service, call (with modem) 800-638-8369. Upon
connection type HHH (RETURN after that). Wait for the U#= prompt. Type
XJM11877,GEnie and hit RETURN. The system will prompt you for your
information.
==========

March 18, 1992

<[Sysop] JEFF.W>
On behalf of the Atari ST Roundtable, I welcome all of you to the Joppa
Software RealTime Conference. Before getting started, some business
about how an RTC works.

While the RTC room is in Listen-Only mode, you can only address our guest
when I let you talk.

To get my attention, just /RAIse your hand. Just enter this from your
keyboard: /rai

I'll acknowledge your raised hand as soon as I can, but please be
patient. I -WILL- let you know when your turn is coming up.

Some other RTC commands are:

? - Lists all RTC commands.
/sta - Status (list) of everyone in
the RTC room.
/exi - Exit the RTC, but you remain
logged onto GEnie.
/bye - Log off of GEnie directly from
the RTC.
/rai - Raise your hand. Lets me know
you wish to address our guest.

And now, let's get started.

In this world of instant access and communication, FAX machines have
become a necessary tool of business.

With the growing popularity and increasing affordability of FAX machines, they are turning up in more and more households all the time.

Personally, it knocks me out that I can order a pizza by sending a fax! It probably won't be too much longer before FAX machines become as common place as telephone answering machines.

But with modems, computers, answering machines, caller ID boxes, and FAX machines all vying for your consumer electronics dollars (not to mention desk and counter space), it's no small wonder that some of these products are being integrated. Which brings us to FAX modems for computers and tonight's Conference guests:

Joining us tonight are Mark Carver and Charles Smeton of Joppa Software.

Joppa has been marketing a Receive Only Fax/Data modem/software package called JOPPA FAX and now they are about to release a new software product called "Straight FAX", a send and receive software package for Atari computers and Class 2 compliant FAX/Modems.

"Straight FAX" is expected to debut at the TAF Show in Toronto next month, but Mark and Charles are here with us now to give us a preview of a product that many have been impatiently waiting for on the Atari computer platform.

And one lucky attendee this evening will win a free copy of "Straight FAX" later on courtesy of Joppa Software, so make sure to stick around!

Welcome, Mark and Charles! Thank you for being with us tonight. Before I open the room to questions, do you have any opening remarks you'd like to make?

<[Joppa-Tech] C.S.SMETON>
Yes one sec...

Joppa Software Development proudly announces...STraight FAX!

Send/Receive FAX Software for the Atari ST/TT Computers

Manufacturer's Suggested List Price $89.95

The STraight FAX! software works with industry standard "Class 2" compliant FAX/modems to bring Group III send and receive FAX capability to the Atari ST/TT Computers. STraight FAX! can also work with Send FAX modems that comply to the Sierra SendFAX command set, to provide Group III send FAX capability to the Atari ST/TT Computers.

STraight FAX! Features
======================

Compatible with all Atari ST/TT Computer models:

- 1 Megabyte of RAM Required
- 2 Megabytes of RAM and a Hard Drive Recommended.
- Shielded RS-232 cable required.
- Compatible with Class 2 Compliant Send/Receive FAX modems.

- compatible Send/Receive FAX Modems include:
- Supra 96/24, 96/96 and 14.4/14.4 FAX modems
- Zoom FMC 9624
- other Class 2 Compliant modems based on the Rockwell chipset
- Compatible with Send FAX modems that use the Sierra SendFAX command set.
- compatible Send FAX Modems include:
- Zoom and Zoom Generic 4800 baud Send FAX modem
- Zoom and Zoom Generic 9600 baud Send FAX modem
- Joppa FAX! SF-01 4800 baud Send FAX modem
- Joppa FAX! SF-02 9600 baud Send FAX modem

The STraight FAX! can be used with all standard serial ports on ST, STe, Mega STe and TT/030 computers and peripheral serial ports tat support the "Bconmap" specification for additional serial ports.

- Note: Some options are not available on serial ports that do not support all RS-232 signals.

The STraight FAX! supports all TOS versions 1.00, 1.02, 1.04, 1.06, 1.062, 2.05/6 and 3.05/6.

- Note: Supplied patch programs from Atari are required to be installed when using TOS 1.04, TOS 2.05 and TOS 3.05.

The STraight FAX! supports all supports all ST/TT graphic resolutions with a minimum screen width of 80 characters, including Moniterm and software large screen emulators.

I don't know how that came out.........

<[Sysop] JEFF.W>
It came out fine here.

<[Joppa-Tech] C.S.SMETON>
But that is a brief overview of the product.

The software allows the T/TT to send or receive FAX documents from any Class 2 compliant FAX/modem.

There are many fax/modems now available and soon available that will work with the STraight FAX!

I guess we can start taking questions.......

<[SDS] S.SANDERS2>
Does the Fax software work in the background and will there be a FSM-GDOS or Calamus driver for it?

<[Joppa-Tech] C.S.SMETON>
The FAX software does not operate in the background at this time. With the release of Multi-TOS background capability will be investigated.

Yes, there are drivers for both Calamus and FSM GDOS as well as PageStream.

<[SDS] S.SANDERS2>
Great!

<[Joppa-Tech] C.S.SMETON>
Let me add one more thing...

The software as it is written will allow scheduled outgoing FAXes while waiting for incoming FAXes, while waiting other Desk Accessories may be used. However, if these Desk Accessories block GEM events, then a scheduled FAX may be delayed or an incoming call not answered.

I have the Joppa SF-02. What upgrade path is available for me?

<[Joppa-Tech] C.S.SMETON>
Mickey we have several upgrade paths that include buying an enhanced send only version, the full software or the full software and a send/receive FAX modem.

Mark, can you give the upgrade prices?

Also, registered Joppa FAX! owners will be receiving a letter shortly with the options.

Thank you. That is all.

<[Mark @ Joppa] JOPPA-SOFT>
Ok.

Option #1 Send Only enhanced version is $20.00.

Option #2 Send and Receive Software is $40.00 and you'll need a Class 2 FAX/Modem such as the new Supra/FAX line

Option #3 is a:
BOCA Research 2400/9600 S/R FAX @ $129
Supra 9600/9600 and software @ $269.00
Supra 14400/14400 and Software @ $329.00

<[Joppa-Tech] C.S.SMETON>
These options are only for registered Joppa FAX! owners.

We are now selling the software as a stand alone product and letting the user choose from the many compatible FAX modems available.

<[Sysop] JEFF.W>
Will you also make modem/software bundles (special prices) available to new customers?

<[Joppa-Tech] C.S.SMETON>
Joppa Software Development will not, however Joppa Computer Products is another RTC. :-).

<[Lindle] L.ROMERO6>
I will be setting up a Turbo BBS real soon and will be getting a Supra Fax modem.....will I be able to put a command in my bbs so my users will have access to it (i.e. from a door)?

<[Joppa-Tech] C.S.SMETON>
Not at this time, the software will only allow FAX mode.

<[Lindle] L.ROMERO6>
Okay, Appreciate it.

<[Joppa-Tech] C.S.SMETON>
It may be possible for the BBS to detect that a FAX is calling and run
the STraight FAX!

<[Lindle] L.ROMERO6>
You mean via a fax switch?

<[Joppa-Tech] C.S.SMETON>
No, actually the modem will indicate a FAX is calling with a result code.

<[Lindle] L.ROMERO6>
Okay....will have to look in the docs for the bbs software, thanks.

can it send to a HP fax at 300 dpi?

<[Joppa-Tech] C.S.SMETON>
G.ZEPKA1, current Group III fax supports resolutions of 203 x 196 and 203
x 98 DPI. The HP may be able to scale this to 300 DPI as it prints.

This is the basic method the STraight FAX! uses to print received FAXes,
via FSM-GDOS drivers.

Thank you.

<[Sysop] JEFF.W>
What kind of file is created for the incoming fax and are software and
printer drivers provided to print them? Are you going to be a licensed
distributor of FSM-GDOS?

<[Joppa-Tech] C.S.SMETON>
The received FAX file is in the same format that outgoing FAX files are
in. It may be FAXed out as is.

The received file can be converted to .IMG format, printed via a GDOS
driver or viewed on screen at different scaling.

At this time we have a license agreement to the FAX FSM GDOS driver. You
will need to contact Atari about purchasing FSM GDOS.

<[Sysop] JEFF.W>
So, what exactly will the user need to have in addition to Straight FAX
and a compatible modem? FSM-GDOS and what else?

<[Joppa-Tech] C.S.SMETON>
FSM GDOS is required to print FAX files, however any program that can
print .IMG files can be used, since you can convert the FAX file to an
IMG file. We also support the ScanLite Desk Accessory from Dr. Bobware
for direct scanning of FAX output.

Minimum memory required is 1 Meg and we recommend a Hard Drive and 2 Meg.
We also recommend a good shielded RS-232 cable.

<[Sysop] JEFF.W>
The FAX-to-IMG feature is part of Straight FAX?

<[Joppa-Tech] C.S.SMETON>
Yes, the program will convert from FAX to IMG, so that a user without
GDOS or FSM GDOS can use Calamus or PageStream or what ever to print the
IMG file.

With Jeff asking the questions we really don't need other users.

What scanners does Scan-Lite support? Does it support the antique
Navarrone, for example?

<[Joppa-Tech] C.S.SMETON>
ScanLite supports Migraph, Golden Image, DAATAScan and Geniscan Hand
Scanners. We are researching support of full page scanners such as the
Canon/Navarone.

Thanks, that is all for now.

<[Joppa-Tech] C.S.SMETON>
If anyone has the technical information on any full page scanner let us
know.

would U tell me what U need to use this software i.e.; supra 2400 and...
etc.? what reads the fax that U send what prints the fax U receive. I am
a electronics tech. not a comp or comm tech. and I am fairly new to modem
world.

<[Joppa-Tech] C.S.SMETON>
OK, the program will take IMG, DEGAS, ASCII Text files and convert them
to a format we call FAX format, this file can then be sent to any Group
III FAX machine.

Received FAX files may be viewed, converted to IMG format or printed via
a GDOS or FSM GDOS printer driver.

Compatible FAX modems include all Class 2 compliant FAX modems such as
the Zoom and Supra.

Also, this is not 100% official but the FONT GDOS program and the
available printer drivers should be available very soon.

<[Sysop] JEFF.W>
Anything else, CN?

So a group III mach. does the send/rec through a zoom/supra and you need
nothing else.

<[Joppa-Tech] C.S.SMETON>
The FAX machine on the other end does not know what type of FAX/modem you
are using.

The FAX/Modem and ST/TT call the destination FAX just as a real FAX machine does. Receive is the same thing, but in the opposite direction.

You go from your ST via Zoom/Supra to a Group III FAX machine and vice-versa.

we seem to be talking a different lang. so I will wait until it is out and on the dealers shelf.

<[Sysop] JEFF.W>
The FAX/Modem, software, and computer take the place of an actual FAX machine on your side, CN. Anything else?

<[Joppa-Tech] C.S.SMETON>
You do not need a FAX machine on your end, that is what the STraight FAX! program and FAX/Modem function as.

Thank you.

<[Dr. Bob] W.PARKS3>
Charles, John, with the plethora of FAX-modems available is there something that we should look for in the way of compatibility or can we safely (or near-safely) assume that just about all the FAX-modems we see advertised would work?

oops- that was supposed to be "Charles, Mark" ... sorry ;-)

<[Joppa-Tech] C.S.SMETON>
Good Question. The latest technology FAX/modems will indicate that they comply with an EIA/TIA standard. STraight FAX! supports FAX/Modems that are "Class 2" compliant, this is an EIA/TIA standard.

Some FAX modems also support an older standard called "Class 1". This is not supported at this time, but is being looked into. The new Supra FAX/modems are both Class 1 and Class 2.

There is a simple test to find out what Class a FAX/modem is:

Type AT+FCLAS=? from a terminal program.

If the response is (0,2) or (0,1,2) the modem should work.

If it says ERROR or (0,1) then it either is not a FAX/modem, an older FAX modem standard or a Class 1.

<[Mark @ Joppa] JOPPA-SOFT>
One other point about the NEW Supra line of FAX/Modems is that they will have as option at a later date of Caller-ID and Voice-Mail, which is being looked into by JSD.

<[Dr. Bob] W.PARKS3>
I see. So it would then be wise to ask the salesperson if the modem is "Class-2" compliant.

<[Joppa-Tech] C.S.SMETON>
This should be on the box, we will post a list of what we know works,

such as the Zoom, and Supra.

<[Dr. Bob] W.PARKS3>
Thanks.

Charles, is there some form of redundancy checking in the FAX modems?
How well does this reduce the effect of line interference?

<[Joppa-Tech] C.S.SMETON>
Current Group III FAX does not support a block protocol with error
checking such as Zmodem, Xmodem, etc.

Thanks.

<[Joppa-Tech] C..SMETON>
Group III FAX has a self recovery algorithm that allows a raster line to
be lost because of line noise, but it re-syncs on the next line. We have
a special method of compensating for line noise of this type, to enhance
the image. We also have a clean up algorithm to remove stray dots from
the image.

Can I send/Save Faxes directly from programs like Pagestream?

<[Joppa-Tech] C.S.SMETON>
The printer drivers that we supply for PageStream, Calamus and GDOS
programs allow you to print to disk from these apps directly as FAX
files. You then exit the app and run STraight FAX! to send out the FAX
file(s).

The quality of computer generated FAX files is quite nice. It is not far
behind a Laser Printer.

Great! Where can I get one?

<[Mark @ Joppa] JOPPA-SOFT>
Joppa Software Development's new address is:

PO Box 214
Dallastown, PA 17313-0214
(717)428-3231 / (717)428-0424 FAX

<[Sysop] JEFF.W>
That all for you, CB?

Yes, Thanks!

<[Sysop] JEFF.W>
We'll take another question, then pause briefly to give away a copy of
Straight FAX.

If I have A SEND/RECEIVE FAX modem; do I only need the software or do I
have to send you the modem?

<[Joppa-Tech] C.S.SMETON>
Yes, if it is Class 2 compliant you only need the software.

Use the test listed previously or Call us and tell us what FAX/modem you have. We will step you through the method to verify it.

Thanks.

<[Sysop] JEFF.W>
Okay, now for the neat stuff. Thanks to Joppa Software, we have a copy of Straight FAX (the software only, no modem) to give away.

You will need your own hardware so if you don't plan on buying a fax modem, please let the others have a chance to win.

<[Joppa-Tech] C.S.SMETON>
Jeff, this will be sent to the winner once the product ships on April 7th.

<[Sysop] JEFF.W>
Good point, Charles.

Here's what we'll do...

I'm going to ask a question and you have to answer it. Everyone will have a chance to type in their guesses before I take the room out of Listen Only mode.

The first person whose correct answers show up will win. Mark and Charles will be the judges of who has answered correctly.

Remember, type in your answers, but don't hit ENTER until you see the room has been opened up for talking.

Now the question...

Name three (3) features of the Straight FAX software package.

JEFF.W> I'll give you 20 more seconds from now before I let y'all fire away with your answers.

[Twenty seconds later...]

Room is now in the talk mode.

Kidpublisher Professional, Kidpainter, Super Kidgrid...

send, receive, store F

Receive Capability, All Class 2 MOdems, GDOS or FSM GDOS Printout

Send and receive faxes, convert img

SEND, Receive, transmit pagestream on

<[Dr. Bob] W.PARKS3>
It works with ScanLite!
It works with ScanLite!
It works with ScanLite!

That's three for me! ;-)

It does the dishes? :)

<[Joppa-Tech] C.S.SMETON>
It looks like J.D.BARNES is the winner, what do you think Mark?

<[Mark @ Joppa] JOPPA-SOFT>
I guess it's JD Barnes.

<[Joppa-Tech] C.S.SMETON>
Congrats JD

<[Sysop] JEFF.W>
Congrats, JD!

Congrats JD

Congrats, JD

Thanks, you made it too easy.

Gosh...

You mean it don't do the dishes?

:)

<[Sysop] JEFF.W>
I think Dorothy and Dr. Bob had good answers too, but not quick enough.

<[Joppa-Tech] C.S.SMETON>
Well JD, if you give you name and address to us privately we will send it
out when it ships.

YO! My answer was first!

<[Sysop] JEFF.W>
JD...Send email with your mailing address. Congrats again!

Now we'll resume...

Hello, I purchased a Joppa FAX modem & Just the FAX software about a year
ago and they have performed very well (unsolicited testimonial).

What upgrade path are you offering to Owners of Just the FAX and what are
the upgrade procedures?

<[Joppa-Tech] C.S.SMETON>
Thank You.

The upgrade options were presented earlier in the conference, we will
have a transcript and a Press Release with the full details.

You can call us at the number listed and also we will be sending out
letters to the current owners.

<[Mark @ Joppa] JOPPA-SOFT>
Also, please make sure the registration card is sent in, we have more out
then registered.

<[Sysop] JEFF.W>
Anything else, Bob?

I ALWAYS send my registration cards in :-) That's all thanks.

<[Dr. Bob] W.PARKS3>
First, off: Happy Birthday, Jeff! Many returns!

<[Sysop] JEFF.W>
Thank you, Dr. Bob!

<[Dr. Bob] W.PARKS3>
Mark & Charles, you'd mentioned that FSM-GDOS is required for printing
and we covered that pretty well, I don't mean to repeat anything.

BUT.... did I see mentioned that ordinary old regular GDOS will work too?

<[Joppa-Tech] C.S.SMETON>
Yes, if you have a older style FSM driver.

<[Dr. Bob] W.PARKS3>
How about good ol' G+Plus?

<[Joppa-Tech] C.S.SMETON>
Also the newer FSM Drivers will function with the older GDOS and
compatibles.

The FAX FSM Driver we include will work with ANY GDOS

<[Dr. Bob] W.PARKS3>
Ok thanks. That's ALL FOR ME.

<[Joppa-Tech] C.S.SMETON>
The only problem for the non-FSM GDOSes is a source of bit mapped fonts
at the proper resolution.

Happy B-day, Jeff. Now my questions:

Since I just got here, I'm probably asking things that have previously
been answered. In order to use this, do I simply need the software and a
SEND/RECEIVE FAX modem? About how much would a set up like this cost?
Will it work with ANY printer? And, will it work with ALL Atari
machines?

<[Joppa-Tech] C.S.SMETON>
If everyone will pause a moment i will upload some more tech info........

The STraight FAX! User Interface Features:

- Full GEM Application
- Drop Down Menus with keystroke command equivalents.
- On screen movable Function Key Bar for most common commands.
- Context sensitive On-line Help available by pressing Help Key.
- Popup Menus make system preferences easy to choose.
- Optional sound effects.
- Enhanced Dialog Box Interface:

Alternate Key button selection
Arrow Key selector list movement
Position Text cursor with mouse over any character of any text edit field.
Undo Feature
Insert/Type over Text entry modes.
Delete to end of Line
Insert any GEM character using Alternate Key and Numeric Key Pad (on any TOS version).

FAX Features:

- Supports from 2400 to 14400 Baud Send and Receive FAX rates (maximum baud rate depends on the FAX/Modem utilized).
- Fine Resolution (203 x 196 DPI) and Normal Resolution (203 x 98 DPI) FAX modes supported.
- Tone or Pulse Dial.
- Full control of FAX Modem speaker and speaker volume.
- Displays 20 character FAX Identification string of Remote FAX.
- Allows specification of 20 character FAX Identification that is sent to remote FAX.

Send FAX Features:

- 100 Number FAX Dialing List.
- Automatic Cover Page Generation.
- Multi-Page FAX Documents of up to 255 pages.
- ASCII, Image and DEGAS file formats supported.
- Full GEM Character set supported for ASCII to FAX conversions.
- Send Logs indicates status of all FAX documents transferred.
- Broadcast FAX documents to up to 100 destinations per FAX document.
- Schedule FAX transmission at a delayed time.
- Schedule up to 30 Multi-Page Multi-Destination FAX documents for delayed transmission.
- Scale Image/DEGAS files during conversion with page positioning options.
- Automatic optional Page Heading added to the top of each page.
- Automatic Redial upon busy or failed FAX transfer.

Receive Features:

- Receive Logs indicates status of all FAX documents received.
- Automatic Receive FAX can be active while waiting for scheduled outgoing FAX documents to be transmitted.
- Manual FAX Receive.

FAX View Features:

- View up to a total of four Image, DEGAS or FAX files each in a separate GEM window.
- Reduced 50% size view.
- Stray pixel clean up.
- Save portion of graphic in view window as an Image or FAX file.

- Auto correction of detected errors in received FAX (due to line noise).
- Scan into a window using a Hand Scanner and Dr. Bobware's ScanLite (Migraph, Golden Image, DAATAScan and Geniscan Hand Scanners supported).

Printing Features:

- Print Image or FAX files to any printer supported by user supplied GDOS or FSM-GDOS printer driver (GDOS, GDOS compatible, FONT-GDOS, or FSM-GDOS required along with the appropriate printer driver).
- Special support for Atari Laser Printers (SLM-804/SLM-605).
- Convert FAX Files to Image format with optional GEM metafile for printing via GEM OUTPUT program or importing into any application that supports Image format files.
- Auto correction of detected errors in received FAX (due to line noise).

Printer Drivers:

- "Print to Disk" FAX Files from the following applications:
- Calamus 1.09x
- Calamus S/SL
- PageStream 1.8x
- PageStream 2.1
- FSM-GDOS driver for applications that support GDOS or FSM-GDOS printing.
- Printer driver output file path set program/desk accessory allows the destination FAX filename to be set any valid file path.

Utilities:

- Time Set Utility for ST's without battery backed clock.
- Line Impedance Trimmer adjustment utility for Send FAX modems.

OK that's it!

<[Joppa-Tech] C.S.SMETON>
any more questions?

<[Sysop] JEFF.W>
Jeff - Did that answer your questions? Anything else?

I saw it said 'works with any TOS', does this include the new Multi-TOS?

<[Joppa-Tech] C.S.SMETON>
Multi-TOS has not been released yet. It may or may not work. We try to follow all the rules and work closely with Atari.

BTW, I would like to thank Atari's Bill Rehbock and Mike Fulton for helping us get the FSM driver built.

<[CANUK] B.KLASSEN>
Hi, will this software work with UIS III, Multi-desk?

<[Joppa-Tech] C.S.SMETON>
Yes, we have tested many other utilities and there should be no problem.

One utility that caused a problem has been the Neodesk Control Panel, however.

<[CANUK] B.KLASSEN>
Will it work as a Desk Acc?

<[Joppa-Tech] C.S.SMETON>
Currently it is a program, a desk accessory version would be made available, but it will require 2+ megs of RAM

<[CANUK] B.KLASSEN>
How about a TT with 8MB? more when I put in the RAM!

I assume it will work in TT MED!! (hope!)

<[Joppa-Tech] C.S.SMETON>
TT/030 should be fine. We will announce enhancements like Desk Accessory and Multitasking when available.

The program requires a graphics mode that supports 80 columns minimum.

<[Sysop] JEFF.W>
Okay. It's time to draw this RTC to a close.

I want to thank Charles and Mark for being with us tonight and everyone who attended.

Congratulations again to J.D. Barnes, our Straight FAX winner.

Any closing words, Charles?

<[Joppa-Tech] C.S.SMETON>
Yes...

We thank the owners of our earlier products (Joppa FAX!) and look forward to April 4th and the debut of the STraight FAX!

As we now say.......

Get the
STraight FAX!
for your Atari ST/TT Computer!

Thank You.

2857. MiNT 0.93

Newsgroup: comp.sys.atari.st
Date: 1992-03-21 12:51:10 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992Mar21.075110.1067@uwovax.uwo.ca>
Source record: 224432

MiNT 0.93 is now available for anonymous FTP from atari.archive.umich.edu.
The files are: mint093b.zoo (binaries) and mint093s.zoo (sources).
Docs are included with both files. The new version has a lot of bug fixes,
some more compatibility enhancements, and (of course) some new features like
better cursor key support.

I've also uploaded a revised set of utilities (mntutl93.zoo). If you already
have the MiNT 0.9 utilities (mntutl9b.zoo) then you won't need these, since
the new/changed utilities are included in the MiNT 0.93 archive; mntutl93
is there only for people who are getting the utilities for the first time.

2858. Full kermt (command line version) wanted

Newsgroup: comp.sys.atari.st
Date: 1992-03-21 13:20:52 UTC
From: r0mill01@ulkyvx.louisville.edu
Message-ID: <1992Mar21.132052.21306@vlsi.louisville.edu>
Source record: 224404

I'm looking for a full kermit (preferably the modified source for such) that supports sliding windows, extended packets, server mode, and all that jazz. I'm looking for a non-gem version that can simply be launched from a CLI, do it's work and exit. VT100 emulation would be nice but not necessary. These things exists for those (inferior) PC-Clones. Is there one for the ST?

Thanks and all that.

Robert Royar

2859. TimeWorks DTP 2.0 ???

Newsgroup: comp.sys.atari.st
Date: 1992-03-21 13:28:53 UTC
From: r0mill01@ulkyvx.louisville.edu
Message-ID: <1992Mar21.132853.21437@vlsi.louisville.edu>
Source record: 224437

Is this really available for the ST? Where can I find out? I have the PC version at work and would love to be able to transfer from home to there because I've got a much better printer in the office, but the olde TW DTP compatibility was file format only--fonts were sized differently and required a lot of work to reformat an eight-page newsletter.

Robert Royar

You describe the Atari Transputer Workstation which, at one time
was planned for volume production - specialising particularly in Fast
Graphics or anything demanding fast floating point numbercrunching power.
The SCSI port would also be useful - but nowadays you get those on the
Mega STE's

> Deleted description of boards etc.

>
For Pelicon, read Perihelion (the hardware Co. was based in Cambridge
England (Richard Miller, now with Atari USA used to be one of their team
and the "boss" was Jack Lang). This company was charged with developing the
ATW. They developed Transputer Boards (called Farmcards) to house the
Inmos T-800 Transputers (you describe such a board - and the links are the
four T-800 links). Initially they housed these in what was called a
Polyhedron - we bought one in 1987 or so with 21 T-800 on board for the
purposes of parallel Molecular Dynamic simulations. This continues to
serve us well - when all T-800's are going in parallel we have the
equivalent of about 20 MegaFlops (or about half the speed of an old Cray 1-S
Supercomputer). Of course, since then there are better, faster transputers
- which are also used in our field of research. Oh, I mustn't forget the
Software side of Perihelion which still exists (based at Shepton Mallett
England). I "think" the team there were headed by Tim King & included
Charles Grimshaw and others. They developed the "Helios" operating system
for Transputers - a Unix-like system that used Parallel C and Parallel
Fortran. We had the earliest version of Helios for our Polyhedron and,
as we were not interested in Graphics or Communications, our interfacing

requirements were adequately met be a simple Kuma Board. The interfacing program (called SERVER.PRG) was I believe compiled uniquely for us by Perihelion Software. Suffice to say after many teething problems (which was to be expected I suppose) we got our system working very well for our rather specialist kind of Application. Perihelion Software continue to support Helios - but now concentrate mainly on PC-interfaces - for which there is a bigger market. Overall the system is quite similar to a Meiko Transputer Surface (or whatever they called it) but with a much more ambitious operating system that did not force you to work in Occam.

>The machine was made in Germany in 1989. I can maybe get a hold of five of

>
>Any suggestions, comments, inquiries invited. Perhaps it is the lost
>Transputer?!?!

Well they are a bit out of date, but we'd like a few to enhance our Polyhedron Based system and, of course, we have a Helios software license which might be expensive to get anew.

So, if you cannot think what to do with them, send us a few - I'm sure we could afford the shipping costs!!

Seriously, on a practical note, you have to be able to develop your own software, of course. Don't expect "Packages" to be available. Also the Parallel (or Meiko) Fortran is very bare (no additional embellishments to the F77-ANSI standard) but if your requirement is sheer number crunching power, this delivers the goods. The parallel "C" is probably better equipped than the Fortran - it being the language used by the developers of Helios themselves. Oh, and by the way, the offered editor in Helios, is our familiar Public Domain MicroEmacs compiled in Helios "C", of course - it is very satisfactory.

We were sad when Perihelion (Hardware) ceased to be involved with Atari - I don't know the politics - but there were some bad feelings around. Perhaps the writing was on the wall when Richard Miller (who, in those days, was designing the Fast Graphics Chip - name forgotten, sorry!) left for Atari, USA. We take comfort in the fact that the hardware purchased off them has no moving mechanical parts - the Hard Disk etc. are all normal Atari Hard Disks and the interface is via a Kuma Board that plugs into the Cartridge Port on any ST (we use a Mega ST-4 - but a 1040-ST would do almost as well! - Still it is nice to load a 2 Mbyte RDY ramdisk which has all of Helios and its tools on it - and of course "other" RDY ramdisks can be used to receive the results of our simulations - enabling the hard disk to be turned off during overnight runs - although in case of mains failure we generally keep the hard disk going.

Well I hope this is some interest to you and others.

Cheers, W. Alan B. Evans
[wabe@ukc.ac.uk]

George, Atari announcemd months ago that it wasn't going to make a CD-ROM drive. Since it was going to just put it's name on another manufacturer's drive anyway (I believe it was Sony), they're just telling folks that when the time comes, they can just buy a Sony drive and use that.

This program is the in-house development tool used by Incentive Software for the FreeScape games (Driller etc). The team who developed Freescape have now moved on and are now developing full virtual reality systems (hardware + software) which sell for 10's of thousands of pounds.

(I happen to know this cos I went to school with one of the team, Sean Ellis. Oops.. I seem to have dropped a name there!)

>I've already asked in that newsgroup and no one answered :-(

I made this enquiry some time ago. A Motorola employee said that Motorola never made a faster 68010 than 12.5 MHz, all the Motorola 68010 were NMOS chips and they never made a CMOS version either. Also it seems that Motorola have stopped making 68010's so there is just some old stock or secondhand parts to choose from.

Therefore the best option is to find a second source manufacturer who does make 68010 chips, one of them is bound to be specced at 16 MHz, and likely to be CMOS. Failing that get several 12 MHz 68010 chips and find out by trial and error which one runs best at 16 MHz. With some decent cooling on the CPU you could not go far wrong, though I understand that CMOS parts are less likely to fail at higher speeds than their NMOS counterparts.

The only real reason to use a 68010 instead of a 68020 is would be to plug it into an existing CPU socket on a 68000 accelerator or the ST motherboard. It is possible to run a 16 MHz 68020 at 8 MHz with no adverse effects, and the extra benefits of the 68020 far outweigh the slightly higher CPU cost and the hassles of connecting the 68020 to a 68000 system.

2867. Atari mega 2 st and Hard drive - 325.00

Newsgroup: comp.sys.atari.st
Date: 1992-03-21 20:15:29 UTC
From: rick@jpusa1.chi.il.us
Message-ID: <1992Mar21.201529.28535@jpusa1.chi.il.us>
Source record: 224414

Atari Mega st 2
tos 1.2
ICD Advantage+ host adaptor
Adaptec 4000a SCSI/MFM adapter
10 meg drive

All the standard stuff - mouse, keyboard, joystick.
Hard drive and adapters in an old XT style case w/ power supply

PD stuff on request, one commercial game(Eye of Horis).

Good shape - have had zero problems with it.

325.00, or maybe a trade for a FAST cd-rom drive.

Call Rick at (312)989-6354

There is a review of TimeWorks DTP 2.0 in the March issue of Current Notes. From that article I understand that there is not a US distributor at present and it is avaiable from companies who carry imports.

2875. Sozobon C compilers

Newsgroup: comp.sys.atari.st
Date: 1992-03-22 10:45:00 UTC
From: b790zbc@utarlg.uta.edu
Message-ID: <22MAR199204453110@utarlg.uta.edu>
Source record: 224281

I have a few questions about the various Sozobon C compilers floating around on the various ftp sites. First of all, which one is the most recent? I have seen archive names SOZOBONx.ZOO, SCxxx20.ZOO, AND SOZO133I.ZOO. I've tried the SCxxx20.ZOOs with no problems. The index listing at atari.archive says SOZOBONx.ZOO is the "latest" release, yet it's date is earlier than SCxxx20.ZOO. Also, are the bins included with version 2.0 more recent than the bins included in v1.33i?

Another question I have is regarding the GEMFAST.H file found in SOZO133I.ZOO. Are the routines included in the libraries? If so, which library file?

Finally, to all the people using either Sozobon or Gnu C compilers, what shell do you recommend for the least errors and the most free memory? I have a 1 meg 520ST with TOS 1.4 and I couldn't get Gnu to work very well with Gulam. I've had a few other problems with Gulam, but the only other shell I've tried is PCOMMAND.

Feel free to respond via e-mail to B790ZBC@UTARLG.UTA.EDU.

>the time comes, they can just buy a Sony drive and use that.

Well, the drive in question was a Chinon mechanism as far as I remember.
Atari skipped it because it would end up some $50 more expensive with their
packaging and badging than the same non-Atari badged Chinon drive already on
the market. They would release MetaDOS as Freeware instead, giving everyone
with a SCSI port/adapter the ability to use a CD-ROM drive with their Atari.
MetaDOS v2.0 has just been uploaded to the Archive, I found it there a
couple of days ago. IMHO, Atari would be better off releasing the drive with
their badging, as more people would know that there was such a peripheral
available to the ST/TT machines. Apple sell buckets of overpriced CD-ROM
drives based on a common SONY mech., so why not. If they think that people
shouldn't pay more than necessary for their stuff, OK, but I think that an "
official" Atari CD-ROM would be a good idea, then we'd have something
to base disc production on...

Anyway, wasn't PLI supposed to have their stuff ST/TT compatible or at least
advertise about that. They have large HD's, removables, opticals AND CD-ROM
drives. Any news on this one?

Sure there is! Look under "desk", "desktop info", and you will see that it says "TOS version 1.02" (which is the correct name for TOS 1.2, BTW). TOS 1.4 and above have a scrolling rainbow effect on the fuji within this dropdown (on a color monitor, of course).

>even when the disk is already formatted and has data on it!

Most of the formatting utilities I have seen do more than this (and surpass the built in desktop format). I always use one of these utilities to format my disks (either the Neodesk format, or Universal Item Selector's), because they format faster and better (I use twisted sector formatting for my ST disks, as I would hope everyone else does). The MS-DOS bootsector is just icing on the cake, so to speak.

BTW, I think there are a couple of tiny MSDOS bootsector writting programs, but I never paid any attention to them.

>I know that DC FORMATTER does this, but Double-Click doesn't seem to
>want to publicize the fact. Perhaps the only hackers left in the ST
>world are the ones who hate MS-DOS and refuse to have anything to do
>with it? Or they've all upgraded to TOS 1.4 and no longer care...

I'm not sure what you mean. My docs for DCFormatter say quite clearly that the button marked "MS-DOS" under the "Bootsector Options" menu means exactly what it says.

While it is possible to determine the version by looking at the copyright
dates in the "About..." box in the DESKTOP (as someone suggested recently),
these dates may differ from country to country!

The easiest way: install a copy of XCONTROL.ACC, open the "General" CPX
and click on "Status" - this will display some memory statistics and the
TOS version...

I am posting this message for a friend who does not have access to Internet.

For Sale:

Atari 520ST (512K)
Color monitor
2 disk drives
Deskcart cartridge
3 joysticks

Many back issues of COMPUTE and START! with disks.

$450 or best offer.

If interested, please reply to my address and I will inform him of all offers.

2885. Emacs 18.5[57]

Newsgroup: comp.sys.atari.st
Date: 1992-03-22 22:39:58 UTC
From: waal@cwi.nl
Message-ID: <5743@charon.cwi.nl>
Source record: 224279

Hi,

I'm having problems with gnuemacs (both versions 18.55 and 18.57).

With regard to version 18.55 I seem to be unable to get C-g (Control-g) to work properly. According to the manual this key is supposed to be bound to keyboard-quit (and apropos: keyboard-quit says that it is indeed bound to that key), but that does not work. Pressing C-g has no effect whatsoever, which is quite annoying since it makes it impossible for instance to abort a find-file. If anyone from sol.cs.ruu.nl is listening: I downloaded the emacs.ttp from that archive (which looks like a dumped emacs executable to me) to compare it with the copy that I have and that version had the same problem.

With regard to version 18.57 I can make a dumped executable (with working C-g), but as soon as I try to read a file, I get two bombs.

Since I use gnuemacs at work (on a Sparc) and like it a lot, I would love to have a decent copy on my Atari too. I would appreciate if anyone could help me with this.

I have a 1040 STf, TOS 1.2. The contents of my autofolder does not make any difference in the above described behaviour.

> desktop - very bad.

Well, there is a way to tell if you do NOT have TOS 1.0. Double click a
text file from the desktop. If the Cancel button is the return-default
button (there's a slightly darker outline around it) then you have 1.0.
If the Show button is the return-default button, then you have at least
1.2. Also, if you check the About... dialog, and the Atari symbol has
rainbow colors running down it, then you have TOS version 1.4, at least.

"Dammit Jim, I'm a free man, not a number!"

This is a chain .sig. Yes, you too can have great wealth and good fortune
if you, (and 20 of your friends) copy this line into their .sig files...

2887. Re: PostScript interpreter (news release)

>Price - Despite it's incredible feature list, CompoScript has a
> SRP of only $349.95.
>

This sounds quite nice, but do these guys know about ghostscript?
It may not be quite as slick, but it can do most of the things
in the 'incredible feature list' for incredibly less money (it is
free). I would personally find it hard to justify the extra expense.

This might be a good time to mention that I have made some improvements
to GS 2.3 that I will be posting soon (as soon as a small bug is fixed).

- The improved sceen driver uses the vdi to determine the screen
resolution, so it should work on most MONOCHROME (still no color)
screens. It reportedly works on a TT hi-res mono monitor. I don't
know for sure about anything else. If you would like to do some
tests for me, let me know. Unfortunately, the small bug mentioned
above is in this screen driver. It crashes alot under certain
circumstances. By the way, is there anyone out there who has
any idea of how to write a color driver for this beast?

- Output can now be redirected to the printer. Thanks to Bammi for
fixing the gcc libraries.

- Chris Strunk (of CS-TeX fame) donated some code to speed up printer
output. For heavy graphics, print speed to my DeskJet can increase
by almost a factor of 4.

- The clist bug has been fixed. This means that the virtual memory
feature of ghostscript can be used by people who have limited memory.

Then GS 2.4 will be released in a few days and all of this will be
obsolete. Oh well ...

Hi atari user

I look for spectre user on TT/STE in order to exchange experiences. For the moment I have big problems to avoid spectre not to crash on my TT !!!!

I think it could be nice to start checking all software that make spectre crashes (and minor problems.....) on ST/STE and..TT. In my opinion it could be useful to get a such list in order to facilitate the hard life of spectre user (I personnaly check spectre with more than 200 software on STE/TT).

Don't hesitate to mail me

charles@aurora.unice.fr

Tony.

2889. Re: HD's & STE's DMA

From: elendir@inf.enst.fr
Message-ID: <1905@ulysse.enst.fr>
Source record: 224292

-> > I had a STE with faulty DMA-chip some time ago and when I tested
-> > it with a special program it ran fine for almost 4 hours. The program

-> last time I had to reset the boot partition... now when I get to
-> the time when things go wrong, I get a little <write error 0001>
-> or something like that on the top right side of the screen, and the
-> HD survives intact :-)

The problem with the DMA chip is located in the internal FIFO of the chip.
There seems to be some kinda internal timing problem ; the result is that
sometimes (this is surely deterministic, but what is the cause ?) the 32th
byte in the FIFO is lost. Then, if the block read is part of FAT or a sub-
directory, then all the informations get shifted... and when it is written
back, all the structure is lost.

Atari never said why this problem arose... but it does !

Enjoy,

Vincent.

2892. Atari ST - Book and Software package deal for sale

Newsgroup: comp.sys.atari.st
Date: 1992-03-23 11:46:16 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.92Mar23114616@zappa.FtCollins.NCR.com>
Source record: 224295

I'm offering the following Atari ST software packages for sale:

STOS BASIC, The Pawn, Jinxter, Infidel, Suspect, and the Rings of
Zilfin, Batman: The Caped Crusader.

and the following book:

Learning C: Programming Graphics on the Amiga and the Atari ST.

$45 takes them ALL, I will NOT sell in pieces. Shipping is free, if you
want COD it is $4 extra.

All disks originals with docs, all have original packaging, also, except
STOS and The Pawn.

--
Sales pitch follows:

The book: Presents the C programming language and its application in
graphics. Discusses wire frame techniques, polygon filling, hidden line
removal, clipping, more. All examples are designed to run on both the
Amiga and the ST.

STOS Basic: Extremely powerful BASIC programming language that lets you
control the graphics, sound, and animation capabilities of your
computer. Great for writing your own games and demos. IMHO, this by
itself is worth the $45 asking price!

The Pawn: Fantasy Graphics Adventure from Magnetic Scrolls. An excellent
Graphics adventure, the graphics are still very high quality and the
parser is top-notch, includes online hints.

Jinxter: A Mystery/Comedy Graphics Adventure from Magnetic Scrolls. See
comments on The PAwn above.

Suspect: A classic murder mystery from Infocom. An Extremely challenging
game.

Infidel: An Egyptian archeology adventure from Infocom. This one was
written by novelist Michael Berlyn and has good imagery and an
interesting twist at the end.

Rings of Zilfin: An animated graphics role playing fantasy game from
SSI.

Batman: The Caped Crusader: Excellent comic book style action-adventure.
Includes two separate adventures to complete. The Graphics and animation
on this one are top notch.

2895. TOS version from the desktop

Newsgroup: comp.sys.atari.st
Date: 1992-03-23 14:44:43 UTC
From: boyd@pipe.cs.fsu.edu
Message-ID: <1992Mar23.094443.26698@mailer.cc.fsu.edu>
Source record: 224298

I recently posted that one could read the TOS version directly from the "desktop info" menu entry on the Atari Desktop. As was somewhat rudely pointed out to me in email, this is not correct. I realize now that I was sticking Neodesk and the Atari desktop together in my mind while visualizing this. Sorry about that (and this says something for Neodesk!). The way to tell TOS versions from the desktop is by using the copyright dates and mapping them to the TOS version with the table recently posted to this group.

I went ahead and exited out of Neo for a bit to refresh my memory, and boy am I glad I bought Neodesk!

> What IBM emulators are out there (I have heard of PC Ditto I & II, Access-16)

I use AT-SPEED C16 (distributed by Compo S/W in Uk ~250 pounds) made by Sack GmBh (same lot as GCR?)
its a '286 based Hardware board that sit's on the CPU inside. Bit of a job to install in most ST's (ye soldering iron etc!)but you plug it straight in on an STe.

It's very fast on my ICD 65MB HardDisk (faster than the ST on its own in fact!) and runs MS-Windows3
about the same speed as the GEM Desktop (impressive -I think) -though for Windows you really need 2MEG
of ram at least. Only one or two compatability problems with obscure S/W. It Emulates VGA Mono Graphics-
Well in window's case but badly in most other things for some reason, mainly because of Bios calls to
non existant VGA Hardware which 'proper' PC's have. CGA emulation is Rock solid - have yet to upset that.
Sound is there but a bit slow- Sample playback- Forget it, but the usual bleeps etc are there.

With 2Meg Ram you can Task Switch from GEM -> MS-DOS, but DOS reboots when you switch to it and
stops the GEM program where it is.

One of my friends uses Supercharger (8086 based 4.77mhz) the Latest version allows multitasking between
GEM & DOS and they even supply m/c source and programs to communicate with it from GEM. it has 1Meg ram on
board which my AT-SPEED doesnt and its own internal expansion bus -though in the UK there is nothing
available to fit it as yet. Condor do a faster 286 (SC plus or something) which runs at 16/20 Mhz
depending on the size of your wallet, it's got real PC Expansion slots too so you could wop a VGA card
or Hard Card in it too. Again it comes as a sealed box that you put on to the DMA port.

Someone (Vortex?) do a 386 board too that plugs on the CPU, but at the money and the fact that the
ST H/W slows it down- the ST can only run at 8Mhz (I think) so a 20Mhz processor just has to wait!

Right hope thats nice and unbiased, to summarise: I really wanted a SC Plus'286 but couldnt afford it!
(boo hoo)

Martyn Henderson -> ma_hende@uk.ac.bristol-polytechnic.csd

Any other Emulating types out there (AT_SPEED C16??)

> mail me about it!

Yes there is a ZX Spectrum emulator - a German one that is really good. I got my copy from a UK PD library (Riverdene PDL, if I remember right) after it was featured in 'ST Format'.

It looks as good as the ZX81 emulator and is similar in use. It runs at about 30% of the speed of a genuine Spectrum (on my STFM that is), and needs ~800K free memory. To me, the colours dont look quite the right intensities and the sound is not very good (but I hardly expected it to be). A great plus is the fact that it runs on a monochrome monitor.

I very definitely recommend this program - but I have a slight problem... loading tapes! The emulator came with a game, 'Pool', but Id like to load some of my old software that I wrote many years ago. Does anyone have a program that can load spectrum tapes through a sampler (plugged into the printer port) or through a small bit of electronics to convert audio levels into TTL?

Dave.

2900. Kawai K1 II and Atari MIDI Software forsale

Newsgroup: comp.sys.atari.st
Date: 1992-03-23 15:38:22 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <14343@vela.acs.oakland.edu>
Source record: 224303
Cross-posted to: misc.forsale,misc.forsale.computers,rec.music.synth,comp.sys.atari.st

```
Kawai K1 II - 61 note keyboard, 8 part polyphony + drum kit
64 single patches and 32 multi for stacks and splits
Stereo output, damper, headphone, MIDI in/out/thru
pitchbend, modulation, and joystick voice controllers

will include ibm/atari disk with 11 patch banks and
pd editors. One of the patch banks includes a custom
bank I have created to match the first 64 tones of
the MIDI standard for playing standard midi files

keyboard mechanism recently serviced to make sure
all parts were in working order (standard maintenance)
current list is approximately one thousand dollars

Asking $600 / shipping (o.b.o.)

Master Trax Pro - sequencing software for the Atari ST computer
Full midi sequencing, playback, sysex and sync/smpte control
Multiple windows for tempo, tracks, step editing, etc.
All original materials, boxes, and manuals in top shape.
Includes many sample GS format midi1 and midi0 song files

current list price is about $400!!

Asking $150 / shipping

UltraMIDI - total control workstation from MIDIMouse music
Allows for complete control over your midi environment
control from either the computer or use remote midi
commands from you synthesizer(s) controls. Allows for
manipulating some keyboard displays (Roland D series and
Yamaha DX series - supposedly more if you contact MIDIMouse)
Send sysex, patch dumps, song files or set up entire sets
for playback. Use with parts of songs, and keyboard control
for on the spot arrangement.

Manufacturer suggested list is $249!!!

Asking $100 / shipping

Will give additional discounts for combinations of the above. Send me email
and lets talk!! Thanks

Message-ID: <1992Mar23.161235.23092@lut.ac.uk>
Source record: 224304

Could someone please answer my following GDOS related questions ?

1. What is the meaning of "GDOS ERROR : INVALID HANDLE" from the GDOS clone AMCGDOS ? This error apears when I try to run some programs (Cards & Tetris both Mono games, GPLOT a shareware graph plotting program which I've downloaded from atari.archive [only when saving Metafile option is selected from the FILE menu]).

2. The alternate desktop program GEMINI 1.21 UK runs ok with AMCGDOS, but doesnot load the monospaced screen fonts (BAGE08, BAGE09 & BAGB09) when GDOS, instead of AMCGDOS is loaded. With GDOS loaded, the GPLOT doesnot run at all. What could be the reasons ?

I was using a Mega 2 and a monochrome monitor.

- Rahin

I happen to still use TOS 1.0. I use all the original hardware I got with it also, mouse, monitor, etc. I have a 1040STF, which has slight cosmetic problems due to a floppy replacement I had to do. The Disk drive is the only piece of equipment I have had to replace. Even the mouse which has been dropped oogles of times is original. I have not run across any obvious software incompatabilities, but only in the share/free ware I pull off of atari.archive have I had crashes (which might not be due to the TOS anyway).

Yes, those of us with TOS 1.0 are still around!

2903. OverScan TT?

Newsgroup: comp.sys.atari.st
Date: 1992-03-23 16:51:04 UTC
From: yegerleh@magellan.ecn.purdue.edu
Message-ID: <1992Mar23.165104.9978@noose.ecn.purdue.edu>
Source record: 224306

Hello Everyone,
Someone from Germany mentioned something called "OverScan TT"
which plugs into the VME port. Could one of you guys
over there give us a few details about this? Does it work with
MSTEs? What does it cost, what resolutions does it offer?
Thanks,
Jim

>I built a model of my girlfriends house with it, and gave her a guided tour.
>She was quite impressed...

Can you get fairly detailed with the interior of the house (say, create a
staircase, go upstairs, look around a room, perhaps put pseudo-paintings on
the wall, have vaulted ceilings, etc.) or are you basically just looking at a
bunch of connected cubes? Is speed a problem (on an MHz ST) - is it sluggish?
What would you say is its biggest shortcoming?

Thanks for your insight!

>Looks like to me the '030 add-on industry is going to be short-lived - just my
>opinion.

Strictly speculation here, but if the Falcon uses an 68EC030 (the low-cost
68030 designed for embedded applications) it will not be able to do virtual
memory or hardware-based process protection due to the EC030's lack of an MMU.
This could be important for Unix or other multi-tasking OS's, and if virtual
memory on the SST or TinyTurbo works well, might become a very useful feature
under TOS.

> [...]

As far as I know, the VDI always maps (keyboard dependent) scan codes to
standard VDI scan codes so that GEM programs don't have to care about the
actual mapping of the keyboard: They always get VDI standard scan codes
from the AES event services (as listed in the Profibuch).

As you are the author of the Profibuch, I wonder if I talk about something
completely different... At least, I never needed Keytbl() when I used
alternate keys in my GEM programs. At the other hand, I never remapped
my keyboard with Keytbl()...

Greetings,
Michael

2910. Font filters from various formats => PageStream

Newsgroup: comp.sys.atari.st
Date: 1992-03-23 20:42:56 UTC
From: r3akw@VAX1.uakron.edu
Message-ID: <1992Mar23.204256.24014@news.uakron.edu>
Source record: 224313
Cross-posted to: comp.fonts,comp.sys.atari.st

I recently purchased PageStream 1.8 (yes - I am aware its old but it
was cheap) and am reasonably impressed. I am now looking for a program(s)
to convert fonts from other formats (Adobe Type 1, Corel Draw .WFN,
Calamus, GDOS) to PageStream. Do any such beasties exist? I recall seeing
a commerical package that, I believe, converted Adobe Type 1 to GDOS, but
I can't be sure.

Anyone know more?

Thanks -

2912. Mouse/Joystick switch for ST

Newsgroup: comp.sys.atari.st
Date: 1992-03-23 23:18:45 UTC
From: bb693@cleveland.Freenet.Edu
Message-ID: <1992Mar23.231845.8280@usenet.ins.cwru.edu>
Source record: 224315

Like all students, I need some cash, and like all (?) Atari users, I have to cope with Atari's stupidity in locating the joy/mouse ports. Having solved this problem myself by building my own switch, I would like to start making and selling this switch. I will fully guarantee my product or I will replace it for you for free. But before I start buying the necessary components, I would like to get a rough idea of the potential market. At a VERY rough estimate I will offer the switch at a price of $9.00-$11.00, plus shipping. But as I said this is a rough estimate and may go up or down slightly Please e-mail me to tell me if you're interested, BUT NOT TO ORDER, for now I just need to know how many people are interested.

The switch I envision connects to the mouse/joy port, with about 12-16 inches of 9-wire cable which goes into a small box which holds the switch and two sockets, one for the mouse and the other for the joystick. I will be using 9-wire cable, so theoritically the switch should work with other devices connected to the ports, but i will NOT guarantee that, since I have tested it only with a mouse and a joystick.
However, if anyone would like some other configuration, such as more sockets, I can do that too, but I will have to get back to you about the price since a different configuration would cost me a different amount.

Later!

Source record: 224316

The Stacker program (for PC's) seems a nice way of doubling one's disk space.
However, it probably does some very low-level things. I wonder whether
anyone has used it with ATSpeed C16?

At the same time, I wonder whether anyone has succeeded in corresponding
with the makers of ATSpeed, that is,

Sack Elektronik GmbH
Bleichstr. 49
D-4792 Bad Lippspringe

I have written them several times since buying my ATSpeed. They haven't
answered once. My letters haven't bounced, so I presume the address is
correct.

2917. FOR SALE: 520ST with 1 meg and 65 meg HD

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 03:48:34 UTC
From: gl8f@fermi.clas.Virginia.EDU
Message-ID: <1992Mar24.034834.17281@murdoch.acc.Virginia.EDU>
Source record: 224320

Atari 520ST + HD for sale: $500 + shipping

520ST (+ memory upgrade to 1 megabyte)
mono monitor
BSD 65 megabyte harddrive (Seagate 277R)
1 SS floppy (*)
Abacus book on GEM programming
Classic 1985 Atari Development Docs
Empire: Wargame of the Century
... and random stuff.

I bought this machine in 1986 and it's spent 2/3 of its life in my closet; too many Suns at work to enjoy playing around with my toy. The memory upgrade can go to 2.5 megs by just plugging in chips (but it's one of the older cards, so these are not simms, these are honest-to-god chips); you can go to 4mb with a small motherboard modification.

(*) The only problem with the system is that my floppy power connector is kaput. The drive itself seems to work fine.

First come first serve; send email or leave a message for me at home (804) 971-5887 or work 924-4914.

2918. Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 06:07:10 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Mar24.060710.7733@watserv1.waterloo.edu>
Source record: 224321
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok, I have an opportunity to do some programming, but here's the part that hurts: It's for a mac.. Guess what - I've got an ST and a PC...
So, my question is this: How good is Spectre GCR at emulating a Mac? Will it run _ALL_ software a normal mac will? Are there any 'gotcha's??
Does it just use my built-in memory, so that I would need to get more than my current 1 meg to do anything useful?
What's the general feeling of the Spectre community? Can GCR replace a MAC?
I would appreciate any and all e-mail or postings..
Thanks,

2919. MiNT SIGTSTOP question

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 06:36:47 UTC
From: dstailey@gsfc.nasa.gov
Message-ID: <1992Mar24.063647.4914@nsisrv.gsfc.nasa.gov>
Source record: 224322
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm trying to port ASH, the public domain Bourne shell clone, to the MiNT environment. Job control is supported, but none of the job control related builtins are giving any results. After activating the debugging routines for jobs.c, I got the following results when sending the pause-jove command to a MiNT port of JOVE. Since this is my port of JOVE, I know this does a SIGTSTOP.

```
JOVE (Text) Buffer: Main "[No file]" - (00:01)
wait returns 98, status=4641
Changin status of proc 98 from 0xffffffff to 0x1221
Job 1: changing state from 0 to 2
Signal 33
showjobs(1) called
dowait(0) called
wait returns 0, status=1212144
```

Note that the exit status returned from wait3() is 4641, indicating that JOVE was sent signal "33," which falls outside of the maximum count of signals in wait.h. However, in wait.h I do notice the line:

```
#define WSTOPPED 33 /* fake "signal" for stopped processes */
```

The code to ASH contains no explicit reference to WSTOPPED, but perhaps this is coded into wait3(). Should I add extra code to handle this exit status, or is there something I'm missing?

Thanks for any help.

The program is called Flash II (not 2.0, since the upcoming release will
be the first release of the program) and it is not connected with the
Antic program Flash. I'm not sure why it is named so closely, but it jus
is. I don't know about the features, but I would like to here them if
anyone knows?

According to Gasteiner Technologies the chips (ie. straight replacement for those in an old STe) cost around 100 pounds. I've no idea about the upgrade board for normal STs.

> my keyboard with Keytbl()...

I think what Julian means, is the following:

As Eric stated it is probably unwise to CHANGE to keybord table when several
programs are running since they might get rather confused.

On the other hand is is prefectly permissable to use Keytbl to INQUIRE the
current setting of the keyboard table to map scancode to acctual keys.

It is a problem of some program comming from the states to us poor people in
Europe which have a hardwired keyboard table built in, so that certain keys are
not where they should be (e.g. Y and Z in germany or the pound sign in the UK).
The same problem arrises if someone reacts to keypresses with alternate
(which do not return a ASCII code) by simply comparing the scancode.

So the obvious, world compatible and MiNT allowed method should be:

long key=Cconin(); /* or something with evnt_mesag */

if( Kbshift()&K_ALT ) {
switch(Keytbl((void*)-1,(void*)-1,(void*)-1)->unshift[(unsigned char)key]) {
case 'y':
break:
....
default: /* arrow keys, F-keys etc. */

}
} else {
```

```
switch( (char)key ) {
case 'y':
break;

case 'Y':
break;

case 25: /* ^Y */
break;
....
default: /* as above */
}
}
```

(please forgive me for any bug in this 'program' it typed it from the memory)

bye ... Alexander Lehmann

The german profibuch as you mentioned has been translated to
the Dutch language but I bet your Dutch is as worse as your
German. I don't know nothing about a English translation of
it but maybe your local computer store can help.
B.t.w. for the Dutch readers : I noticed that at the bookstore
'De Slegte' in Amsterdam they offered this translation of the
profibuch and some other Atari ST related books for some
remarkable low prices. They had almost all 'Databecker' books
and others for up to 6 times cheaper as normal ! I am not
connected to 'De Slegte' but if you were always willing to
buy one of these but you thought they were to expensive you
should now have a look overthere.

Source record: 224331

I have been using a ST (with Spectre) and programming with Think C without any problems (the debugger in Think C needs to be modified, but that is not a big problem). However, for any serious use you need more than one meg of memory (I have 4 meg). The compatibility is pretty good, with virtually all major programs running without a hitch. However, one serious disadvantage is that the ST cannot run System 7 of the Mac operating system.

2929. MIDI playback program is ready

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 13:30:13 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Mar24.133013.1712@echo.philips.nl>
Source record: 224332

```
================================================
I tried to crosspost, but it failed (once again).
So sorry, if you see this posting more than once.
================================================

Hi everybody,

The MIDI PLAYBACK program Version 1.0 is born!

For the time being it is available for the Atari ST/STE/MEGA STE only.
I have plans to port it to MSDOS as soon as Windows 3.1 is available.

The program can load and play standard MIDIFILES.
It can adjust a lot of parameters to adjust the file
to your personal keyboard(s)/synthesizer(s)/sound module(s)
/drumcomputer(s) needs. It is based on GEM, however, I
have given it my personal style (I am an artist:-).

It can be used in color (medium res.) and monochrome (high res.).
It will probably work with the newer screen modes as well, but I
have no possibility to test it. The program comes with a help
function, however a manual can be ordered (see below).

You'd better subscribe to comp.binaries.atari.st now, as
I posted it to the moderator of that USENET newsgroup

For those who have no access to that news group,
I have posted it to the cs.ruu.nl archive too.

This archive can be reached either by
anonymous ftp: archive.cs.ruu.nl [131.211.80.5]
or its
mail-server: mail-server@cs.ruu.nl
For more info about this archive contact its
moderator Ate Brink: ate@cs.ruu.nl

My American friend Bill Sheppard will most likely
send it to atari.archive this week (Hi Bill:-).

For those who missed the initial posting in december, here is some
detailed information again:

The program can play the songs stored in midifile format 0 and 1 (*.MID).
When format 0 midifile is loaded, midi events using different
midi channels will be handled as being on different tracks.
The program can handle up to 99 tracks.
The program allows certain events to be filtered.
Tracks can be muted.
```

Each track can be assigned to a midi channel for fast converting.
Each track can initialise the sound by transmitting a program change event.
Each track can initialise volume setting of the connected midi device.
Each track can have its notes transposed.
Each track can have its notes converted via mapping (for drum tracks).
The program holds two mappings which can be modified, loaded and saved.
Each track can be analysed with an event editor showing all the midifile
events loaded (incl. all midifile specific stuff like meta events).
Tempo of the song can be initialised.
Tempo of the song can be relatively changed (still following all
tempo changes which might be in the midifile already).
During midifile loading, events can be filtered for min. memory usage,
in case of 512kB systems.

As written above, the program includes a help function
which gives some information how to use the program.
However, I am writing a manual (in English, German and Dutch)
which goes in the details of the program and gives hints how
to use the program in a practical way. The manual comes with
appendices, which includes the following:
- An introduction for novice midi users;
- A list and explination of midi events;
- An explanation (in detail) of midifiles.

Version 1.0 is free, but not the manual. You do not necessarily
need the manual to use the program, however, ordering the manual
will also result in the newest version of the program, as there
are several features planned for future versions. See the help
function within the program for more details.

So watch out for: PLAYBACK.PRG

> ############### Opinions expressed are my own and usually wrong ##############

Ummm.. it depends on what your idea of 'detailed' is, and how patient you
are. Let me expand further....

The 'World Area' is large, but not infinite. Therefore after you have created
a cube, and its hovering there in mid air in front of you, you have to decide
what sort of scale the model you are building is going to be.

Now, if you are just designing a room, you can get *very* detailed - stripey
towels, quite accurate taps, light switches (you could even have a light switch
that turns the virtual light on and off, and by going right up to the wall and
looking down at the switch, you could see it protruding from the surface of
the wall slightly - now thats detailed!) and so on.

If you are building a whole house, you have to build on a smaller scale,
but you can still get a highly detailed view.

It has to be said that the 3DCK will [quick break while I answer a talk
request - isnt UNIX wonderful!] only give out what you put in. If you
are arty, and use well defined shapes then you will be pleasently surprised.
The interface is a joy to use, if a little slow.

Screen updating is directly related to the number of visible objects.
So the more detail = less speed. I'm afraid it gets quite slow sometimes,
but the feeling of "Being there" is unsurpassed!

I wouldn't want to be the one to try it out! My experience in
the past is that programs that do things to the hard disk are
apt to trash it...I found this to be the case with every disk
cache that I tried. Also, the tech person at the place where
I bought my ATSpeed (only 8mhz) told me to be wary of all
programs that access hard disks directly, e.g. things like
PCTools compress and backup, etc.

I'd be interested in hearing, too...don't take me wrong. I
just would be VERY reluctant to do it!

According to Gasteiner Technologies the chips (ie. straight replacement
for those in an old STe) cost around 100 pounds. I've no idea about the
upgrade board for normal STs.

A few weeks back I saw (and tried out) TOS 2.06 at a show (the 16-Bit Show
if you must know). It was being sold by a third party retailer (German, I
think). I can't quite remember how much it cost, but I'm sure it was nowhere
near 100 pounds (more like 60).

2934. TOS 2.06 Upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 16:15:17 UTC
From: malay@sae.com
Message-ID: <1992Mar24.161517.27880@sae.com>
Source record: 224337

Ok, I got my TOS 2.06 chips in the mail (from Codehead) - I opened up my 1040STe and the "older" TOS roms are soldered-in AND they seem to be two pins smaller. The jumpers are also soldered. Has anybody upgraded to TOS 2.06 with this STE setup. The docs from Codehead implied it would be a simple "pop out the old - push in the new" but I'm a little hesitant to get in there with the old solder-sucker.

2935. Sudden View vs. Intel

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 16:58:06 UTC
From: steve@thelake.mn.org
Message-ID: <A1464014968@thelake.mn.org>
Source record: 224338

Motorola partisan alert:

Below you'll find one of the all-time great anti-Intel screeds from someone who not only knows how to rant, but also how to write, how to code and how to make good computers and software. Rod Coleman founded Sage Microcomputers and wrote Sudden View, a new text processor for the Atari ST that Jerry Pournelle is calling the best editor for any computer, anywhere.

Rod was asked by a user on GEnie's Jerry Pournelle Roundtable whether Sudden View might be ported to PCs. His reply follows.

==========

Category 4, Topic 37
Message 273 Sun Mar 22, 1992
R-COLEMAN at 12:13 EST

Mr. Nash,

In regards to your interest for a port of Sudden View to the Intel processor: Sure! no problem. All I need is a widely accepted true 32-bit operating system with a reasonable Modula-2 compiler running on the PC and I'll get right to it. You see, Sudden View is a true 32-bit product. It allows a contiguous file of a megabyte in size (or many megabytes for that matter). MS-DOS running on Intel chips have a real (no pun intended) problem with this.

As Jerry can tell you, I used to be the counterpoint man (anti-Intel) on some of the industry panels back before Apple was using the 68000; so I've made this case before. Now that Apple defends the cause, I spend my time quietly programming the 68000.

It isn't JUST that I don't like the Intel parts (I've spent years coding for them). It's that they are not real computer processors; they are actually control processors. You know, like the ones running your washing machine. The Motorola 68000 is a cross between a VAX and an IBM 370, which are large architecture machines. It has 16 true 32-bit registers.

On the other hand, a 486 is a 386 with some optimized instructions and a cache. A 386 is a 286 with a sort of 32-bit machine wrapped around it, like a bun around a hotdog. A 286 is a poorly extended 8086 (brain-dead according to Bill Gates; and he should know).

The 8086 (and 8085) were the response to the Zilog Z-80 if you remember back that far. It maintained object code compatibility with the

older 8080 (the now famous 8088 was the 8086's 8-bit little brother).

And of course, the 8080 was an extended version of the 8008, the worlds first 8-bit control processor. Actually it goes back a little further with the 4004, but I don't want to push it.

The point is, that deep in the heart of the Intel 486 there still resides the logical register set of the 8008. To be fair, most PC software (MS-DOS) takes advantage of the 8088 extensions, but they are only extensions. Remember, that 8088 was object code compatible with the 8080 which would only address 64 KBytes with an extenion of the 8008's logical register set. Now you know why a compiler running in MS-DOS in 1992 is still constrained to 64 KByte data structures and very few logical registers. It's because of a washing machine controller originally defined in 1972. Amazing, isn't it?

This has already gotten out hand, and I'm sure I in the wrong topic, but I haven't had that button pushed for some time now. Actually, if someone would write a true 32-bit version of MS-DOS for the 386 and above, with a Modula-2 compiler, Sudden View should be a fairly easy port (are you listening Bill? What! Window 3.1? We'll see). Without that option, it will require a little "adapter" board containing at least a 68020 and a couple of megs of RAM to plug into the PC along with Sudden View.

Maybe if I don't tell anyone what's on the adapter card, they'll be amazed at how well I can make their Intel processor run. For now, you'll have to buy a real computer like the Atari ST. I've already had DOS developers who have done just that: bought a mono Atari 520 ST as an editing station, and just pop the disks back and forth.

Still think the Atari's a game machine? Well, then you'll have to wait for the MAC port which will be done if I sell enough copies on the Atari. Other than that, you'll just have to accept that there is a program running on the slowest computer currently in production (8 Mhz Atari ST) that will do things faster than you can do them on some of the fastest personal computers in production (any 50 Mhz 486 Intel part).

Sorry about the flame, I know your question was ask in good faith. It's just that I find the whole Intel/IBM perversion of technology so frustrating. Anyway, thanks for the question. I hope the answer's clear.

Rod

2936. Re: Motorola 68030 and 68882 and 25 MHz crystal for sale $315

To anyone considering this, note that the following is standard quantity 1
pricing on these items from Motorola (higher quantities are available at
significant discounts):

68030, 25 MHz PGA package: $178.96
68882, 25 MHz PGA package: $ 92.64

The source is the January 1992 price book.

Has anyone tried Artworx's Bridge 5.0 for the Atari ST?
I recently purchased this program and the hands begin to repeat
themselves after several rounds. I thought maybe the randomizer
was using the time/date of the computer, but the problem still
occurs after changing the time/date. I have a Atari St 1040 if it
is any help. What's going on? How do I fix the problem?

On a somewhat related note, was Bridge 6.0 ever released for the
Atari? I know they have it for the IBM and Macs.

Your method is OK if you read keystrokes with Cconin(). But I think it's
another story if you read them with the VDI (or with the AES, which itself
calls VDI): VDI scancodes are independent from the keyboard layout since
VDI converts them to a standard mapping.

(I'm really not sure about that, but my programs always worked fine this way.)

Michael.

I am looking for a bbs in the dayton, ohio area that has this capability.
I logged onto a few atari bbses, as well as some messy dos and mac ones,
but I couldn't find any mention of this capability. anyone who is aware
of such a bbs, please mail me!

Thanks,

Bill

2940. Revised Big Screen info... More still wanted!

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 20:09:47 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Mar24.200947.23121@a.cs.okstate.edu>
Source record: 224343

I'm compiling info on monitor cards available for the ST. I plan to
be using MGR with an accellerator (40Mhz SST?) and need more screen for
multiple tasks! So far, the Crazy Dots looks real nice. Any question
marks below indicate that I've "heard of" the card, but havn't even heard
a rumor(sp?) of the question marked feature.

card max rez comment $US Mfgr/Imptr
1) ISSAC 1024x768 550 Dover
2) ReSolution 1024x768 will do a virtual 1280x960 600 Rio
3) Omnimon ??? ? ?
4) Matrix ??? ? ?
5) Moniterm ??? ? ?
6) CrazyDots 1664x1200 <=16 colors 1280x800 w 256 colors 850 Gribnif
7) CrazyDots 1664x1200 <=16 colors 1280x800 w 32k colors 999 Gribnif
8) SST add-on ??? ? Gadgets
9) Reflex A3 mono only L250uk ?

Can someone (anyone) add some details to this?
Or maybe a few more cards?
Who imports Reflex, Omnimon, Matrix, or Moniterm? Anybody sell these in the
USA? Are any Specs available on the Gadgets "SST add on"?

jc cummins@a.cs.okstate.edu

2941. Memory speed for 40Mhz SST?

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 20:24:43 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Mar24.202443.24567@a.cs.okstate.edu>
Source record: 224344

For those considering building an SST, I ask:

What is the minimum memory speed to get maximum throughput from a 40Mhz
68030 (for instance in the Gadgets SST board)???

How about the same question, but a 50Mhz 68030 and crystal?

I need to budget for expansion, and I plan on going with MiNT, GNU, and
a lot more screen. Please post or e-mail responses! Short answers welcome!!!
(since a few short answers will contain the info I need!!!)

2942. Re: Emacs 18.5[57]

Newsgroup: comp.sys.atari.st

waal@cwi.nl (Peter de Waal) writes:

>I'm having problems with gnuemacs (both versions 18.55 and 18.57).

>With regard to version 18.57 I can make a dumped executable (with working
>C-g), but as soon as I try to read a file, I get two bombs.

Well I solved the problem. I decided to try to create a dumped executable by running dumpemac.ttp from the desktop. I made sure that the environment variables were set by environ.prg in my auto folder. Running dumpemac gave me xemacs.1 and xemacs.2 but it did not not succeed in making a dumped xemacs.ttp. So next I run dumpfix from the desktop (using the dumps created by dumpemac) and I finally got my xemacs.ttp.

This executable, however, when run from the desktop does not automagically loads the startup file, so I rewrote the source of a minimal shell that I have to run gcc and voila. If anybody is interested in this source, just drop me a line.

Well, now I can finally delete all the gemacs 18.55 stuff and reclaim some space on my harddisk.

2943. Re: GDOS infos

Newsgroup: comp.sys.atari.st
Date: 1992-03-24 22:51:00 UTC
From: Patrick_Dubbrow@ms.maus.de
Message-ID: <A37936@MS.maus.de>
Source record: 224346

M.A.Rahin@lut.ac.uk, 23.03.92:

>1. What is the meaning of "GDOS ERROR : INVALID HANDLE" from the GDOS
> clone AMCGDOS ? This error apears when I try to run some programs
> (Cards & Tetris both Mono games, GPLOT a shareware graph plotting
> program which I've downloaded from atari.archive [only when saving
> Metafile option is selected from the FILE menu]).

These programs are buggy because they use wrong handles (f.e. 0,1)
while calling vdi functions. AMCGDOS, rather than original GDOS,
informs you about this.

>2. The alternate desktop program GEMINI 1.21 UK runs ok with AMCGDOS, but
> doesnot load the monospaced screen fonts (BAGE08, BAGE09 & BAGB09) when
> GDOS, instead of AMCGDOS is loaded. With GDOS loaded, the GPLOT doesnot
> run at all. What could be the reasons ?

As mentioned some days ago, GDOS.PRG expects the program to open the
virtual workstation with work_in[0] = 2+Getrez(). This is a silly bug.
1.) Don't use GDOS.PRG!
2.) If you do nevertheless, copy the fontlist to the 01p entry of your
ASSIGN.SYS.

BTW: In the german "ST-Magazin" 4/92 one can find my fix for this
problem of (FSM/)GDOS.

Regards,
Patrick

|>
|> Rod
Well the only thing wrong is that in 7 days IBM is shipping os/2 version 2.0 which is a 32

bit system with a flat memory model. I know one company that makes a modula 2 compiler for v1.x and I assume they will make one for 2.0. Of course you can still complain the graphic system is complex at best, desing by a drunken moron at worst.

2945. CrackArt: Did anyone put together a collection of all the postings?

Newsgroup: comp.sys.atari.st

Subject: e-mail return address correction for Darius Taghavy's FOR SALE st
Expires:
References:
Sender:
Reply-To: dart@lock60.UUCP (Darius Taghavy)
Followup-To:
Distribution: usa
Organization: Lock #60 on the Schuylkill Canal, Mont Clare, PA, USA
Keywords:

Last night I posted a bunch of for sale ads in above newsgroups. I posted this from a Commodore account. Since I haven't worked there for over a year I was threatened before to lose my account. That was months ago. It turns out that they finally went through with it sometime TODAY! So all your replies to darius@cbmvax wil end up in/dev/null or something.

Please re-reply your e-mail to the above path (dart@lock60.UUCP) which is a secondary account I have for safety. Now my PRIMARY and only account.

I am very sorry for the confusion. Stuff for sale: Amiga '020 board $350, '030 board $750, 2 meg RAM $185, AT bridgeboard $425, GVP controller $50, Motorola 68030 and 68882 (25 MHz both) w/ 28 MHz crystal $315 or seperate, EMU Proteus SR $590, Lexicon LXP-1 $370, Roland VP-70 $500, Commodore SX 64 $250, Passport MIDI transport $135, MIDI Gold Insider (A2000 MIDI interface) $45, Dr T's KCS 3.0 $55, Intelligent MUsic Realtime 1.1 $20, Dr T's Tiger Cub Amiga $35, various Amiga Sounquest editors $35 each, MIDI Quest 1.0 $45.

Again darius@cbmvax is dead --- dart@lock60.UUCP is CORRECT.

Thanks,
dart

2947. Tape Drive

Source record: 224349

Morning all... just a few quick questions...

A little while ago I was talking to someone who was writing their own tape driver, and to someone porting some GNU tape stuff to the St. Could they get in touch as I am getting a tape drive this week or so.. I seem to have lost the address and don't know where to find it.. :(

Oh.. and does anyone know if there is a program to play .MED songs on the ST? They seem to be popular, and some are quite long...

Thanks all...

If you would like to help provide Atari users with articles to read,
you can do it by scanning hard copies of articles into ASCII form.

The Cleveland Free-Net Atari SIG has permission from Atari Explorer
and other publications to post articles on Free-Net.

If you have a scanner or have access to one, you and your organization will
be given credit for scanning it.

Thank you.

Len Stys at aa399@cleveland.Freenet.Edu

>or ec333way@sail.uwaterloo.ca

For programming, Think C V4.0. is fine. I made a few inits with it, did
some larger projects. It works very well.

The debugger, source debugger that is, has to be modified with RESEDIT
to map out some checks for a floating point unit, otherwise the source
debugger will dump the Spectre into oblivion.

I could post the resource fork modifications so it works 100%.

Comments about Pascal:

The only problem I have is with Think Pascal's editor...its buggier
than hell on a real Mac too.

2950. UNIX on the TT?

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 05:23:10 UTC
From: morrison@ee.ualberta.ca
Message-ID: <morrison.701500990@ee.ualberta.ca>
Source record: 224352

I remember hearing somewhere that there would be a port of UNIX to
the TT. Could anyone say whether this is more than a rumor? If not, is it
under development as we speak, and just _what_ UNIX are we talking about, old
version, current version, hacked up Atari implementation, what? I would like
to be investing in a UNIX development platform before too much time goes by,
but I definitely don't have the money to invest in a workstation. Will
Atari ever be an option, or will I have to go with something like a NEXT?

Robert Morrison

2951. Amiga bridgeboard featur correction - 68030/68882 pricing

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 06:41:38 UTC
From: dart@lock60.UUCP
Message-ID: <788@lock60.UUCP>
Source record: 224353
Cross-posted to: misc.forsale.computers,comp.sys.amiga,comp.sys.atari.st,pa.forsale,nj.forsale

I am not submitting a (F)ollowup to the two flames I got because the damn amiga.general newsgroup is not available here.

1> I stand corrected. Amiga bridgeboards don't include serial port emulation out of the box because the janus.library does not support it. You may however utilize inexpensive PC serial/multifunction boards plugged in a PC slot on the A-2000 which is THE great advantage you get with a bridgeboard over the other pc solutions.

2> My 68030/68882 pricing is based on an approxiamtely 30% discount on typical mailorder prices plus a free crystal (some $10 worth). E.g. April 92 Amiga World: the Grapevine Group lists the 25 MHz version of those chips for $249.95/208.95 respectively.

I refuse to be flamed by an industry person who obviously gets wholesale prices because he has access to that. If he wants to start a side business with that it's fine with me.

I only have this ONE SET for sale and I believe my original set price of $315 including crystal is fair. However, I will give you 30% of the best VERIFIABLE mail-order price and throw in the 25 Mhz crystal for free.

Just because I happen to know Commodore's dealer/OEM pricing and don't flame people for selling their used Amiga's for slightly less then that. Besides I have better things to do with my time than scan every newsgroup for trivialities every day...

Darius Taghavy (215) 430-7040 days-eves EST

PS I have no interest in a flame war, especially since I'm kermitting files back and forth between my 1200 baud UNIX login session and my Amiga to avoid this godforbidden vi editor.

2952. Re: bbses with uucp support

>How can I tell if a bbs can send mail to an internet site? In particular
>I am looking for a bbs in the dayton, ohio area that has this capability.
>I logged onto a few atari bbses, as well as some messy dos and mac ones,
>but I couldn't find any mention of this capability. anyone who is aware
>of such a bbs, please mail me!

Not very many small BBSs are connected to the InterNet...

You might want to consider using CompuServe for this ability...

For only $7.95 a month, you can join CIS and have InterNet mail capability.
InterNet mail is an extra cost option (although it doesn't cost very
much), and CIS is accessible almost everywhere.

The $7.95/month basic services include unlimited use of several basic
CIS resources including regular CIS E-Mail (but not InterNet mail).

Also, for $12.95 per month, flat rate, Portal offers complete InterNet
access, both Mail and Newsgroups... but from Dayton, you'd have to
either call long-distance, or use PC Pursuit ($30/month by itself).

I for one, did not mean that as a flame, only pointing out that the BB's
don't have serial port emualtion. Due to the nature of your site (and not
knowing that you were not still working from CBM) I took the oppertunity to
express my feelings toward the lack of serial port access via the
janus.library. I do agree that a multi-fuction card is the way to go if you
have the extra slots, however my A3000 only comes with 2 AT slots, of which
one is used by the BB, leaving me with a mear 1 slot for expaning the BB, I
placed a multi-function card in it, that gave me 2 serial ports, along with
alot of other things, however I have no more slots, and would like to add
one of the better sound cards to my BB. If I had known about the A3000T
when I bought my A3000 (I got it in Sept. of 90 and had no idea there would
be a tower version) I would have gotten it for its expantion. The point
was, that if CBM would have included access to the amiga serial port via
janus, I would have one less then to have to add a card for.

Your privce on the chips look good to me, if I needed em Id get em :)

Most used 286 BB's are going for around $250-300, if yours is still new and
in the box and all, your price on it is also fair.

Sorry to hear that you lost your CBM account, 1200 baud?? ACK! You have my
sympthy!

2955. My setup for G++ is:

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 08:48:31 UTC
From: warwick@cs.uq.oz.au
Message-ID: <7304@uqcspe.cs.uq.oz.au>
Source record: 224357

Well, there have been a few requests for this: a working setup for G++.

Extract of my environment:

```
GCCEXEC=e:\bin\gcc-
GNUINC=e:\include\gcc
GNULIB=d:\lib,e:\usr\lib
GXXINC=e:\usr\include,e:\include\g++
```

some other usefuls:

```
HOME=D:\home
MAKEFILES=D:\lib\default.mak
PATH=D:\bin;E:\bin;D:\mup;.;D:\mint\bin
TEMP=g:
TMP=g:
TMPDIR=g:\
```

I don't think these do anything, but they were in gnu.g:

```
ar=e:\bin\gcc-ar.ttp

2956. Re: PostScript interpreter (news release)

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 10:36:34 UTC
From: HAC041@DJUKFA11.BITNET
Message-ID: <92085.103634HAC041@DJUKFA11.BITNET>
Source record: 224360

In article <68910@ut-emx.uucp>, timg@ncsa.uiuc.edu (Tim Gallivan) says:

>This sounds quite nice, but do these guys know about ghostscript?
>It may not be quite as slick, but it can do most of the things
>in the 'incredible feature list' for incredibly less money (it is
>free). I would personally find it hard to justify the extra expense.

I can't speak for Goldleaf, but I do know a lot about CompoScript
(I was involved in its development) and something about
GhostScript (from a user's point of view). Of course my opinions
can't be unbiased, so I won't say much, but I would like to point
out that there are substantial differences when you actually want
to *use* both programs for something useful (as opposed to talking
about theoretical feature lists).
Therefore my advice for anyone who is interested in a PostScript
emulator and does not in general reject the idea of paying something
for software is to take a long hard look at all programs
available and consider their relative merits for his/her
purposes.

This appears when a program tries to access a VDI workstation with handle 0 (which is a bug).

>
>2. The alternate desktop program GEMINI 1.21 UK runs ok with AMCGDOS, but

>

Only AMCGDOS allows to use font files in Motorola format. You'll have to convert them to Intel format to use them with other GDOS versions (I am not sure which font editor allows the conversion).

>standard VDI scan codes so that GEM programs don't have to care about the
>actual mapping of the keyboard: They always get VDI standard scan codes
>from the AES event services (as listed in the Profibuch).

No, it doesn't. You need Keytbl() to process things like Alt-A correctly.

2959. Re: ATARI ATW800

From article <1992Mar21.110424.7178@lth.se>, by d91jn@efd.lth.se (Jerker Nilsson):
> A few people have told me that ATari UK still sell ATW. Is the same true for
> Atari Germany? Can one find program there? My friends would love to get a
> Occam-compiler, can Atari Germany/UK fix that??
>
This is what Atari Germany told me, when I asked for an ATW (~4 months ago):

q: info material? a: nothing available
q: software? a: ATW is delivered with Helios 1.3 and X11R4
q: dealers/support a: none/none (ATW is only sold directly from Atari)

(source: Mr. Mester, Atari, Raunheim, Germany, Phone +49 6142 209163 or
+49 6142 209129 from 9-12h and 16-17h)

But there was a T*-card for STs from Kuma (?), shipped with an Occam-Compiler.
Perhaps someone can supply more accurate info on this topic?

I have been using the Atari System V for 2 months now, it really exists.
To get more information it's the best to contact Atari directly.

Please do post the modifications.
It will make Think C a very useful adjunct for Spectre.

Personal Note.

I bought Spectre to protect my ST hardware investment.
So far all "meaningful " programs run just fine.

2969. Mouse/Joystick Switch for ST

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 20:31:59 UTC
From: bb693@cleveland.Freenet.Edu
Message-ID: <1992Mar25.203159.17990@usenet.ins.cwru.edu>
Source record: 224371

Like all students, I need some cash, and like all (?) Atari users, I have to cope with Atari's stupidity in locating the joy/mouse ports. Having solved this problem myself by building my own switch, I would like to start making and selling this switch. I will fully guarantee my product or I will replace it for you for free. But before I start buying the necessary components, I would like to get a rough idea of the potential market. At a VERY rough estimate I will offer the switch at a price of $9.00-$11.00, plus shipping. But as I said this is a rough estimate and may go up or down slightly Please e-mail me to tell me if you're interested, BUT NOT TO ORDER, for now I just need to know how many people are interested.

The switch I envision connects to the mouse/joy port, with about 12-16 inches of 9-wire cable which goes into a small box which holds the switch and two sockets, one for the mouse and the other for the joystick. I will be using 9-wire cable, so theoritically the switch should work with other devices connected to the ports, but i will NOT guarantee that, since I have tested it only with a mouse and a joystick.
However, if anyone would like some other configuration, such as more sockets, I can do that too, but I will have to get back to you about the price since a different configuration would cost me a different amount.

Later!

My axels are spinning properly but the optical detecor unit (or something farther up the line) is not registering the rotation of the disk! I am experiencing symptoms like only bing able to move up/left/right (not down) or not being able to move verticaly at all (neither up nor down). The mouse has had *very* moderate use and is only about a month old (no receipt to return it). Is there a way to fix this short of getting a whole new mouse? Is there someone that sells replacement optical units cheap? Is this in the FAQ? Is there a FAQ? Am I annoying you yet?

2971. GEMulator (was Re: Sudden View vs. Intel)

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 23:07:01 UTC
From: fergus@areaplg2.corp.mot.com
Message-ID: <1992Mar25.230701.1432@lmpsbbs.mot.com>
Source record: 224373

Rod Coleman was asked by a user on GEnie's Jerry Pournelle Roundtable whether Sudden View might be ported to PCs. His reply was:

> In regards to your interest for a port of Sudden View to the Intel
> processor: Sure! no problem. All I need is a widely accepted true 32-bit
> operating system with a reasonable Modula-2 compiler running on the PC
> and I'll get right to it. You see, Sudden View is a true 32-bit product.
> It allows a contiguous file of a megabyte in size (or many megabytes for
> that matter). MS-DOS running on Intel chips have a real (no pun
> intended) problem with this.
>
> ...if someone would write a true 32-bit version of MS-DOS for the
> 386 and above, with a Modula-2 compiler, Sudden View should be a fairly
> easy port... Without that option, it will require a little "adapter"
> board containing at least a 68020 and a couple of megs of RAM to plug
> into the PC along with Sudden View.
>
> ...you'll just have to accept that there is a
> program running on the slowest computer currently in production (8 Mhz
> Atari ST) that will do things faster than you can do them on some of the
> fastest personal computers in production (any 50 Mhz 486 Intel part).

Why, you just run Sudden View using Darek Michoka's GEMulator on any fast MS-DOS machine, right?

All sarcasm aside, the GEMulator sounded like a real stupid idea in the first place, but do these comments of Rod's mean that the GEMulator can't possibly work as advertised, and is really pretty much worthless?

2972. SLIP for ST(E)/TT?

Newsgroup: comp.sys.atari.st
Date: 1992-03-25 23:43:32 UTC
From: m91der@tdb.uu.se
Message-ID: <1992Mar25.234332.24414@tdb.uu.se>
Source record: 224374

Does anyone know if there is some kind of SLIP-package avaliable for the ST(E)/TT? I've looked around a bit, but I couldn't find a single program that looked like SLIP.

Any help or advice is welcomed!

>
>You don't read the Atari News, the CD-ROM was droped last year, the software
>MetaDos2 is on A.A for those that would like to make there own CD-ROM..

Well, all I read was that Atari only decided not to sell CD-ROM "hardware".

They announced some agreement with PLI ("a leading manufacturer of high-performance, SCSI-based peripherals"), who would sell CD-ROMs, rewritable magneto-optical drives, 88-Meg removable-media drives, and suchlike, primarily for the TT market. And presumably one could hook up any SCSI CD-ROM drive to any ST with the appropriate host adapter.

I didn't see any announcement from Atari (at least in the major magazines) about the software. I have been waiting 6 1/2 years for Atari to release the CD-ROM software they demonstrated at the 1985 Consumer Electronics Show! If Atari has really thrown up its hands and released it into the public domain, is MetaDos2 actually "usable" software for the unsophisticated user like me? (Apparently the editor of CURRENT NOTES doesn't think so. He recently editorialized about having to buy a PC solely for the purpose of reading CD-ROM disks.)

Perhaps you need a PC emulator to usably access data on PC-format CD-ROMs? Even then, can you display the pictures as well as the text? Has anyone ever tried it? Has this already been written up somewhere?

Does anyone in the Atari community care about this CD-ROM business, anyway?

Sheesh, I was just trying to inform people that the price was high relative
to what they cost new. As far as I know the Motorola quantity one price is
not a wholesale price, its a price that they will sell to joe-blow-off-the-
street for. Apologies if that's not true.

I'm looking for a book I bought about 4 years ago (and subsequently lost..).
I believe it may have been published by Compute!, but I do know the name
was "Programming Graphics on the Amiga and Atari ST". It was ring-bound with
a white cover.

If you have this book and would like to part with it (admit, you never use
it!), please email me. I'm more interested in the linear algebra portions,
since the graphics info was not that useful, and would like to get ahold
of another copy.

Thanks,
Dave

2980. Atari ST GIF viewers

Newsgroup: comp.sys.atari.st
Date: 1992-03-26 03:51:07 UTC
From: daniel@ucscb.ucsc.edu
Message-ID: <31376@darkstar.ucsc.edu>
Source record: 224382
Cross-posted to: comp.sys.atari.st,alt.binaries.pictures.erotica.d

I'm hoping someone can give some suggestions as to some good GIF viewers for the atari. Specifically, I'm looking for something that can view the gifs at their normal resolution, leaving the rest of the image accessible with the slider bars. Also, the smaller size the program the better. Anyway, any suggestions would be greatly appreciated.

2981. SCSI Hard Disk Info - and -

Newsgroup: comp.sys.atari.st
Date: 1992-03-26 03:59:03 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992Mar26.035903.26540@cdsmn.mn.org>
Source record: 224383

I have a question and some information to share. First the info:

Alot of people have asked questions about hard disks, partition sizes, etc. Well, I had the opportunity to get my hands on an Iprimis Elite I, 1.2Gbyte (yes, that's Gigabyte) SCSI disk over the last weekend. I'm not posting this to say, "my disk is bigger than yours" as I only had it on loan. I've just never heard anyone here talking about any disks this big on the ST yet.

I have an ICD AdSCSI Plus adapter and I am using ICD ver. 5.1.0 software. The ICD wasn't able to see the entire disk, it was able to deal with one gigabyte of it. This is not so bad considering that an Adaptec AHA1740 EISA SCSI host adapter (for PC) currently has this same limitation.

I could have partitioned it as one huge chunk using the BGM partition type (anyone tell me what BGM stands for?), but the cluster size was too large using big partitions. I did go ahead and partition it in to two equal chunks of 512k each, but even then the cluster size was 16kbytes. I think that's a little impractical. When I partitioned it down into six chunks, I got down to more usable 4k clusters.

Of course, in order to boot from the disk, I had to make the bootable partition GEM size (I think 33.?? was the magic number).

I tried to partition this disk with HPX (ver. 5.0), but it told me to get a different WIN.CAP. The HDX docs said "should be able to handle anything... Only uses WIN.CAP for ST506", but I guess I shouldn't believe everything I read!

If this is all common knowledge, sorry.

Now, MY QUESTION: Totally unrelated to hard disks. I have found that when using the VT52 emulator, stevie, or vanterm, my cursor does not go to where I'm trying to point. I just figured out a moment ago that it is TurboST that is causing the trouble (TurboST installed = bad cursor, TurboST removed = good cursor). Now I saw something on atari archive called cons_fix to "Fix console output from TurboST and QuickST". Is this what I need? Kinda sounds like I'm answering my own question!

p.s. Craig Shore, thanks! My mail to you has been bouncing, but I'll keep trying.

There are a few posts concerning a software package that lets you place objects and then animate/or journey through your design... (etc).

Is it availible in the U.S.?

If so, then how is it?

What resolution does it work in? Is it fast? Does it take a lot of time to render different P.O.V.s? Does it render a frame at a time or is it real time animation (through the constructed (?)...)?

Cost (U.S.)?

Thanks in advance!

2984. MutliTOS info from GEnie

Newsgroup: comp.sys.atari.st
Date: 1992-03-26 07:25:05 UTC
From: as666@cleveland.Freenet.Edu
Message-ID: <1992Mar26.072505.29903@usenet.ins.cwru.edu>
Source record: 224386

There's some great MultiTOS discussion going on at GEnie. I can't post the messages here as they are copyrighted by GEnie (gack!) but I'll tell you what the latest news is.

There is no offical date or cost for MultiTOS yet.

MultiTOS is completely based on MiNT.

Most GEM programs should run as-is.

There is no limit to windows in MultiTOS. They are "allocated dynamically". You can open as many windows as you have RAM for.

You can run as many GEM programs you have RAM for. There is _NO_ limit!

Applications will be listed under the desk accessories, and you can switch to a one by clicking on it's window to "top" it, or clicking on it's name under the DA area.

MultiTOS will automatically cut the time slice of any program that is "idleing". CPU time is given out in a "on demand" type basis, where active programs get time, and inactive ones do not. CPU time is NOT given out on a "xx% for this program" type basis. MultiTOS maintains MiNT's provisions for given more or less priority to certain programs.

--

That's it for now. I hope this is informitive, and helps to stop some rumors. It _will_ run on a 68000 fine.

>

3D Construction Kit is available for ST/STE in France since last autumn.
Price is FF450 (~US$75).

Moreover, I've seen a demo of it on a cover disk from an UK mag
(I can't remember which one for now, floppy is at home)
together with a demo of RezRender and a converter 68000asm -> GFA Basic.
(And other things I don't remember).

You really can create and animate 3D scenes, and there's possibilities
to incorporate those ones in your own programs...
Apart from the demo, I've never used it for real.

>to have lost the address and don't know where to find it.. :(

It is me.

My version of a SCSI streamer tape driver is considered to be
ready. If there is any interest I will post it (to
comp.sources.atari.st?). At the moment there is the driver, tar
and a full disk backup/restore utility. The driver is clean, the
rest is a little bit ugly because I only implemented it to test
the driver - I only wanted to test the driver in a standalone
environment before including it into Minix.

It is based on the old sources by Paul Moreau.

There was someone else who said he did the same thing plus
porting GNU-tar. He did not show up again.

Wolfgang

I talked about an Atari person on CeBIT about that TT UNIX thing.
His comments were:

1) Available to end users in two or three month's time
2) UNIX System V Release 4
3) No end user price fixed yet
4) Shipping to developers now
5) Developer's set (hard&soft) for about 8000 DM (+14% tax, I presume)

I left a business card, and now I'm waiting for a quote.

While I was at the 16 bit show at Wembley, England (Atari Corp put on a good show) I asked some bloke who wasdemonstrating the TT about when the CD-ROM would be available. He said that Atari Corp had developed most of the accessories needes for CD-ROM including a read/write version, but they had cold feet on which mechanism to adopt and where waiting to see which type would become the market leader. (Either commodore or Phillips). Which ever company was the market leader Atari would adopt a similar mechanism. He ended by saying that it would n't be available until late this year !
Maybe he was full of bull shit but it sounded quite convincing . . . . . .

No compile doesn't work, though I think it is fixable. I get a 'start-process is void' message. Once I get a copy of the emacs lisp reference manual I'm going to have a go at fixing it.

>button (there's a slightly darker outline around it) then you have 1.0.
>If the Show button is the return-default button, then you have at least
>1.2. Also, if you check the About... dialog, and the Atari symbol has
>rainbow colors running down it, then you have TOS version 1.4, at least.

Another few features of different TOSes:
If you choose (a menupoint with the meaning of) "save set-up" from menu
"Options", TOS 1.0 will save the set-up immediately whereas TOS 1.2 and
higher come up with a dialog box asking if you want to save set-up.
TOS 1.4 and higher can be known by their ability to MOVE files instead
of copying (just as copy, but you hold down control on the keyboard).

But of course there ought to have been a version number in the About
dialog.

BGM is BIG GEM I think. Maximum partition size is restricted to 256 Mbyte.

>Of course, in order to boot from the disk, I had to make the bootable
>partition GEM size (I think 33.?? was the magic number).
You can boot from BGM partitions, too.

Why 'of course'. AHDI and some other drivers do not have this limitations (they can use BGM partitions as boot drive).

I think part of the reason is that even though it's a completely new program, many aspects of its operation are the same and will be familiar to users of Flash 1.x. Thus, a better chance of selling to users of the old program.

For instance, DO scripts are supposed to be compatible (although the script language on the new version apparently adds many more commands).

>
>If so, then how is it?
>
>What resolution does it work in? Is it fast? Does it take a lot of time
>to render different P.O.V.s? Does it render a frame at a time or is it real
>time animation (through the constructed (?)...)?

Low resolution only. Different POV speed depends on the number of objects, but
in general its pretty fast.

I think you have the wrong idea about it... its isnt a 'frame by frame' thing
at all, EVERYTHING, from the creation,manipulation and setting of objects is
done in realtime, fully 3D, right in front of your eyes.

Its pretty remarkable. It could be better I think if they really went to town
optimising it, but it doesnt really have any competition, and its quite useable,
robust and has great results, so why bother.

A typical 'play' might consist of...

Load it up. Click on the 'cuboid' icon. Click on 'Create'. Blam! A cube appears.
Now, drag it round the screen, change the viewpoint of the user, color the
cude, resize it in X Y and Z dimensions. Translate (move) it to where you
want it. Now create another object and repeat.

Of course, you can always come back to the object later and move, re-adjust
kill or whatever it.

EXACTLY like lego really, except with no nobbly bits on top!
Unless you put them there yourself....

You can have several methods of interaction. During the creation of your
virtual world, you can use the mouse to move around (click on direction)
. You can then 'rubber band' a viewport, and select 'test'. The screen is
blanked except for that viewport, and you can use the joystick to zoom
about with.

You can define logic... eg you can create one world, then 'link' it to anther
via an object (say a doorhandle), so the size is limited only by the number of
worlds you have memory for. Each world is of finite (though huge) size.

You can also define interaction.. for example make walls impervious so you cant walk though them, gravity so you can make a skyscraper and jump off, looking at a tiled floor rushing up at you.

Its all rather fun really!!!!

3000. Uploading text files to Unix Servers

Newsgroup: comp.sys.atari.st
Date: 1992-03-26 15:42:51 UTC
From: psurge@cs.utexas.edu
Message-ID: <kt3s7rINNgo@sahara.cs.utexas.edu>
Source record: 224202

Is there any way to strip the line feeds off a text file for sending to a server or mainframe? My case in point is this:

I have created postscript files in Pagestream (v1.8) and want to send them to my computer account at the University for printing. If I use Kermit, then I have no problem, but zoo'ing a PS file can yield up to 90% compression. However, when unzoo'ed on the mainframe, all the line feeds are still there.

This is not only a problem with Post script files, but with any text file I would like to send. Is there any way, either on the UNIX or ST side of the process where I can strip the line feeds from a text file.

Thanks,

Troy Carpenter

3001. Zmodem won't send .ARC or .ZOO

Newsgroup: comp.sys.atari.st
Date: 1992-03-26 15:49:35 UTC
From: psurge@cs.utexas.edu
Message-ID: <kt3skfINNgu@sahara.cs.utexas.edu>
Source record: 224203

I have been having a problem sending .ARC and .ZOO files to my Unix account.
I am using XYZ 2.1 (?) sending any of the above type programs using the Unix
rz command. This is what happens:

```
--------
ST>xyz -u filename.ARC

[Header info deleted]
Sending filename.ARC
[progress info deleted]

Switching to offset 0
[progress info deleted]

timed out

ST>
--------
```

This also happens with filename.ZOO, however text files will be sent without
any problem and I did not try to send any uncompressed applications (non-text).

If anyone has any idea, please let me know. Thanks in advance.

```
Complete computer system for sale:
----------------------------------

o Standard 1040ST (1M RAM/Internal 3.5" floppy)
o Monochrome monitor
o Colour monitor
o Monitor switcher
o ATI 2400etc/e external modem (w/MNP)
o Spectre GCR (Great 128K ROM Mac emulator)
o Seagate 277N 65 Meg external drive (w/ Supra controller)
o 100+ disks of utilities, games, applications
(Most store-bought, some PD stuff)
o Panasonic "Near Letter Quality" dot-matrix printer
o Mouse and a couple of joysticks included
o A ton o' manuals

The system has never given me a day of trouble (except for that day I
accidentally crushed the mouse under a bookshelf [don't worry, I bought
a new one]), but I'm buying a larger system upon graduation (next month,
hopefully...).

Best offer gets it...

Hallo,

ich moechte C++ lernen und das ginge ja am besten, wenn ich
zu Hause auf meinem Atari eine Compiler dafuer haette. Ich
besitze derzeit PURE-C und habe daher den entsprechenden
Menschen auf der CeBIT gefragt, ob seine Firma gedenkt C++ fuer
den ST herauszubringen, und er meinte fruehestens naechstes Jahr
wuerde es eine Vorabversion geben, solange moechte ich aber nicht
warten !
Zwar weiss ich, dass es den GNU++-Compiler gibt, aber dessen Instal-
lation war mir bisher bei weitem zu muehsam, zudem ich auch auf
keinem ftp-Server eine vernuenftige (wenn moeglich auch noch deutsche:-)
Installationsanleitung gefunden habe.
Meine Frage ist nun : Gibt es noch irgend einen anderen C++-Compiler,
oder existiert wenigstens irgendwo eine ohne groessere Muehen
installierbare Version des gcc und g++ ?

MfG

> No, it doesn't. You need Keytbl() to process things like Alt-A correctly.

I finally have to contradict myself.

In the meantime I tried again with appl_* and found out that it returns
exactly the same keyboard scan codes like the BIOS.

Forgive me if I confused you... I must have misunderstood the Profibuch
in some way... And I've never noticed any problems since my scancode.h is
fixed to a German keyboard (and not, as I thought before, to the VDI
standard). Surprise for me.

Every decent text editor has an option to replace text. You should replace all the linefeeds with -nothing-. I suppose this is best done at the Unix-side, not on the ST (for obvious reasons). Ask your sysop how to 'find and replace' using the available text-editor at your site.

You'd probablyu best get yourself decent arc/lzh/zoo/zip programms. they can be obtained by anonymous FTP from atari.archive.umich.edu, directory atari/archivers (or a variation on this dir's name :-) I myself use ARC_602.TTP, ZOO2_1.TTP, LHARC.TTP and STZIP.TTP. They all work fine, although LHARC needs some updating.

>Any help or advice is welcomed!

There is an atari port of the KA9Q package available at atari.archive.umich.edu
and several other places. This prog handles SLIP, SLFP (some versions), and
various other protocols such as AX25. It provides you with telnet, ftp,
smtp and other types of connections.

Side note: Anyone know if there's a ver. of KA9Q for the ST that supports
PPP (point-to-point protocol)? The new vers of ka9q for the msdos machines
support it nicely, but the latest ST port I've found is from '88 or so and
does not include PPP support...

You're probably seeing the effects of a comm line that isn't completely 8-bit transparent. From the unix host, try invoking rz with the -v (verbose) option to cause it to generate debugging output:

$ rz -vvv { more v's increase the verbosity level }

After the transfer, check /tmp/rzlog to see what sort of error it reported. What you may need to do is turn on the "escape all control characters" option, either at the sending or receiving side. The newest Unix rz doesn't support the -e option (so you'll have to use it on the sending side), but I think the previous version did. If XYZ 2.1 supports the option (I know for sure that STalker 3 does) then it may be enough to let you transfer the file.

3012. Atari Stacy 4 for sale

Newsgroup: comp.sys.atari.st
Date: 1992-03-26 20:07:24 UTC
From: eggert@sun.lclark.edu
Message-ID: <1992Mar26.200724.29402@lclark.edu>
Source record: 224214
Cross-posted to: comp.music,comp.sys.atari.st

As much as I hate to do this, I am selling my Stacy.

Atari Stacy 4 computer:
4 meg RAM
40 meg Hard Drive
3.5" 720K disk drive
TOS 1.4 (Rainbow TOS)
Mouse and joystick ports
Expansion port
Parallel port
Serial port
MIDI ports
DMA port
Monitor port
Floppy drive port
Power Supply
Original box

Accessories:
Atari Mouse
VIDI ST real-time digitiser
IMG scanner
VideoKey for TV/VCR hookup
Monochrome Monitor
Color Monitor (top and bottom of screen distort on color monitor
should be a fairly minor repair)

Software:
Cyber Paint
Laser C compiler
Laser C Debugger
GST C comiler
Personal Pascal
Dungeon Master
Dungeon Master II: Chaos Strikes Back
Elite
Carrier Command
Captain Blood
Gone Fishin'
Starglider II
Falcon
Lots and lots of Public Domain software

All of this equipment has been taken care of very well. I hate to part with it, but I haven't used it much since I started college and I can't really justify letting it sit here.

$1700 takes everything

This is a good price if you consider all of the hardware that comes in the deal. The programming software is also very expensive. The Stacy also has some advantages over the new STBook that is coming out (such as a backlit LCD display and a floppy drive built in - plus normal MIDI ports)

I will sell the Stacy without any of the extras for $1200. I will also sell the monitors separately for $100 each. The Digitiser, scanner, and VideoKey could also go separately if the Stacy sells first.

Source record: 224218

>You don't read the Atari News, the CD-ROM was droped last year, the software
>MetaDos2 is on A.A for those that would like to make there own CD-ROM..

Does anyone in the Atari community care about this CD-ROM business, anyway?

I would probably buy one of the online encyclopedia CD-ROMS for my Atari if
1. I was confident in the software.
2. I could get a drive at a reasonable price that was guarenteed by
the vendor to work on my Atari (w/ICD AdSCSI)

I also want a SCSI tape backup device. I am unwilling to get ICD's backup device
because of its incompatability with everything else. 1/4 inch tape, 8mm or dat
are viable products for my needs.

3017. Any Children's SW?

From: randyh@hpsad.HP.COM
Message-ID: <750125@hpsad.HP.COM>
Source record: 224219

And now for something completely different. :)

I read this group all the time and love the information I get from it.
But, there is something I seldom see here. That is children's software.
I can imagine that most on the net are students or whatever and don't
have children. But I do, and I would like to know if any of you out
there might have any share/free/pdware children's software that you've
just been waiting for a reason to upload it to atari.archive. ;)

Well now is your chance!!!

Seriously, if anyone could help me I would really appreciate it.
I have 3 DA Brumleave progs (potato, aikin drum and kid_mixup) so I
don't need those.

Thanks alot,
Randy

>docs from Codehead implied it would be a simple "pop out the old - push in the new"
>but I'm a little hesitant to get in there with the old solder-sucker.

Well, I just updated an 1040STE with socketed ROMs. The old ROMs are indeed 4
pins smaller. Once you have the new ones succesfully inserted, you have to move
two of the three (soldered-in) jumpers, this are the two which are next to the
ROMs. I do not see any easier solution than de-soldering the old ROMs - but if
you have a little bit experience, it should be no problem. The ST boards are
easy to de-solder if compared to some other computers - they have nice big
holes around the IC pins, so you can get the solder out easy.

3025. Modular compilation in Personal Pascal

Newsgroup: comp.sys.atari.st
Date: 1992-03-27 01:06:02 UTC
From: youngmw2@mentor.cc.purdue.edu
Message-ID: <42538@mentor.cc.purdue.edu>
Source record: 224226

I need to compile a link module in personal pascal but whenever
the main program is compiled I get an "undefined symbol" error.
What's up?

the module has the format:

```
---------------------------------
{$M+,E+}
program the_module ;

procedure the_actual_module( avariable : long_integer ) ;
...

begin
end.
---------------------------------
```

and in the program it is called by

```
---------------------------------
program main_program ;

procedure the_actual_module( avariable : an array of something ) ;

EXTERNAL ;

begin
...
end.
---------------------------------
```

The idea is to pass the pointer to the array to the module so that the module
will receive it as a long integer for purposes of putting graphics on the
screen (an XBIOS(5) call).

I have version 1 of personal pascal if that matters and I've done everything
that I can find in the manual and I am getting very frustrated so any help
would be greatly appreciated.

Thanks,
Mike

As posted elsewhere, get KA9Q from atari.archive.umich.edu.

Someone else asked about PPP - I ported the version of KA9Q that's currently on atari.archive. I have been working on a newer version (from NOS) with PPP but haven't had much time for it.

>Could someone provide a few details on Sudden View. Where is it
>available? How much? What's so great/not so great about it?
>Graphics support? Postscript? Will it wash dishes?

I'll include with this a pared-down version of some release information from ST-Report (8.10).

1) Where available?

a) Check the atari.archive, in /atari/editors/sudden.lzh (or something HIGHLY similar). This is the "demo" edition. It's somewhat painful to use (Sudden View is NOT shareware, but rather that peculiar variant sometimes known as "crippleware." It STRONGLY encourages you to order the "real" version.), but can definitely give you a feel for the "proof of concept." If you spend a couple of hours with the demo, you'll either love it (and HATE the author for crippling it!), or realize you don't really want it.

b) From the author in Las Vegas. 1-800-something. Check the "release info."

There are TWO versions: "Student" ($25.00) and "Personalized" ($65.00). The "student" edition is apparently still slightly crippled, but includes a real manual, and is apparently much less restrictive than the "demo" edition.

FYI, I've got a "student" copy on order. I'm sufficiently impressed that I'm willing to go half-way. If it's really for real, I'll probably spring for the full edition.

2) "What's so good about it?"

Speed, speed and speed. It reacts REALLY fast. Great for browsing files.

The keyboard control system is more sensible than anything I've ever seen in an editor before.

It's simple to use fairly well.

It is NOT a word processor. That's fine with me - I use LaTeX for text formatting, and would be quite happy to use the SAME editor for both programming and "word processing." No, it doesn't know PostScript. If YOU know PostScript, it can handle PS stuff. (This being a facetious comment.)

Now, for the "press release." I'm not certain to what extent this is a "review" or to what extent it is "propaganda." Based on the demo edition, I would say that none of it is verifyably UNtrue.

Sudden View In Final Release
Reno, Nevada - March 1st, 1992

According to Rod Coleman of Sudden Incorporated, the final release of Sudden View has just been shipped to dealers. After several months in Beta test, 126 changes and enhancements have been made to produce the final version for the Atari ST. It now supports Moniterm and TT high resolutions, as well as 8 X 8 font on monochrome monitors.

Sudden View is remarkable for its fresh approach to editing fundamentals. It uses something called Virtual Control, which allows the user to have the feeling of virtually touching his text as he edits and arranges it.

Sudden View's most obvious feature is its ability to dynamically scroll text and move text blocks. These functions occur in real time and in direct response to the user's movements. The program responds quickly enough to move the text as the user moves his hand.

>cbb.comment: VERY real-time. Rather fast.

Even though Sudden View only edits ASCII files, they are internally indexed so that the user can display any part of the file instantly. This is true whether the file is two Kbytes or two megabytes long. Another difference is that Sudden View has no "Insert" or "Replace" modes. Editing action is cursor-position dependent, allowing the user to just place the cursor and type. If the cursor is over a space to the left of any text, it will insert; otherwise it will replace.

All deletes and changes are kept in a twenty-element buffer stack so that the user can restore something that was deleted some time ago. This buffer stack also works in concert with Dynamic Text Arrangement as a scratch pad.

Sudden View has no margin bar, yet can support as many different formats as the user wishes. Each line is its own format. Therefore, the format conforms to the user's actions, and not the other way around. It is also very flexible in setting and adjusting word-wrap.

The Power Menu is another unique feature of Sudden View. It is a multiple-level menu system that can be keyboard- or mouse-activated. Even though it is as fast as normal power key combinations, it requires no memorization. Learning it is very natural.

>cbb.comment: The "Power Menu" IS a neat idea.

Quick Find in Sudden View allows the user to do a partial-key dynamic search for any character string. It searches as the pattern is being entered at over 100,000 characters per second. Normally, the string is

found before the user completes the pattern entry.

Sudden View's copy, cut, paste, and move features are its real strengths. It defines four different types of text blocks which can be selected and manipulated without using any menus. The block types are Character, Sentence, Field and Line. They allow for a very direct and powerful arrangement of text.

The user can drag a Sentence through a paragraph as it dynamically re-formats in real time. A group of Fields or a column can be deleted, replicated or moved as the user directs. The text becomes an extension of the user's thoughts; control is virtual.

Since Sudden View presents a significant number of new concepts, a Student version is available at $24.95 suggested retail. It has all of the standard features and complete one-hundred page manual as well as occasional study breaks for learning the program.

>cbb.comment: I just hope that the breaks show a HELP screen rather >than the annoying commercial of the "Demo" edition.

The Master version has several extra features for the advanced user but no study breaks. Owners of the Student version can upgrade to the Master version for $40.00, or both versions can be purchased initially for a suggested retail of $64.95. Sudden View files are not copy protected.

>cbb.comment: One positive thing: NO premium for starting with the >student edition, and then upgrading. $24.95+$40.00=$64.95.

The Student version is available from Atari ST dealers now. Either version can also be ordered directly from Sudden. For more information, contact Rod Coleman, Sudden Incorporated, 5081 South McCarran Blvd., Reno, Nevada, 89502, or call 800-421-4228 for orders or 702-827-2996 for support or other questions.

--- End of possible advertising propaganda section ---

I hope that the product succeeds. It seems a little quirky, but definitely has some areas of brilliance.

There's been a LOT of talk about MultiTeX, most of it being fairly vague on availability and pricing. Could we get some hard data to work with?

If someone has a copy of the "Readme" file, it would probably bear posting (unless it's some 15K monster... If so, then there must be SOME information that can be removed in order to make it shorter).

I'd like to know:
1) Where would I send money to?
2) How many DM is it? Conversion/transfers of funds are not THAT big an issue. I can get money orders at my bank, as can most people. The currency translation rates are published in the paper, so that I'm not afraid to hear the cost in Marks, Pounds, or (even) US $. All are foreign currencies to me :-).
3) Is there a specific listing of new features?
I have this nagging suspicion that I'll probably not bother to upgrade until LaTeX 3.0 comes out. The current set of software does my documents quite well right now. I don't NEED to upgrade, but would consider it if it was really worthwhile.

It should probably be noted that TUG (the TeX Users Group) is in the process of setting up a "clearing house" that provides MANY versions of TeX for various computers. (Notably: EmTeX (80x86), PasTeX (Amiga), OzTeX (Mac), CS_TeX (Atari)). Most of this stuff is being offered as "Public Domain" (or some rough equivalent - I'm NOT talking in any strict way about copyright law).

TUG would be a fairly natural "second source" for MultiTeX. I expect that there could be some sort of distribution agreement with them.

I'm a little tired of seeing really vague information about MultiTeX. Could we get some HARD information, please?

No, but what you can do is get a SCSI controller card for MFM-RLL drives
(the Adaptec 4050 is popular). So, your host adaptor connects to the
SCSI controller, which connects to your PC hard drive(s) (you can connect
more than one to most SCSI controllers). This is doable, but it would
probably be better to go straight SCSI (better performance, less complexity).
If, on the other hand, the PC hard disk you are being offered is very large
(or if you can get a big box of them :-) you might want to try this one.

Here is a file I typed long ago about "rolling your own" ST hard disk.
Enjoy!

>I am looking for an inexpensive HD a starters HD. I am looking for a used
>maybe 20m or more CHEAP!!!

You might want to try rolling your own. It is very easy for the ST. You
need:

A host adaptor
A power supply
An enclosure
A SCSI drive

I recommend the ICD Host adaptor. It has (IMHO) the best software, which is
updated frequently (and available free). They also provide a very easy way
to add a battery backed up clock to your ST (if you don't have one already,
they can be bought with or without the clock). I also like ICD's because they
report any "sense codes" the drive communicates to the user. I have only
seen one ("read error with recover", induced by dropping something heavy on
the desk while the hard disk was reading), but I find it reassuring that
any weirdness at the device level is reported directly to me (it pops up in

the corner of the screen, by the way). Price is about $80 at last look. Without the clock, you save $10. Order the SCSI connector cable whereever you get the host adaptor, and make sure to ask for a dual drive one with a red wire denoting pin one (to make the installation easier).

Power supplys are cheap. Just pick up an old XT power supply for ~$30 from computer shopper. If you can find a junked PC, you can get one for free.

Enclosures can also be cheap. You can buy one of those huge old style XT cases for about $30 from computer shopper. This will hold all the hard drives you will ever want! Buy a tower stand for $5 and stick it on the floor (the ICD cable is nice and long for this). You can also go all out and buy an enclosure which will fit under your monitor (mine houses 2 5.25" devices, has a front mounted lit power switch, mates perfectly with the ICD board, etc) with power supply for about $125. There are several places that sell these for the ST, two being Toad Computers and D&P Computer Supply. Email if you want their 1-800 numbers. Again, a junked PC is the absolute cheapest way to do this. If you can get ahold of grannys old IBM XT, you are in fat city. A nice side bonus is that the old PC motherboards make great wall hangings (big fat traces, lots of chuncky looking components). Old PC's are really easy to find, now that everyone is going to 80x86 machines.

Now, the SCSI drive. These can be bought from computer shopper. All you need is a bare SCSI device, no other boards or anything. The ICD host will work with just about anything, but there is a very large list of already tested drives that comes with the host adaptor (which I could probably email to you also). Drives are very cheap nowadays, and if you want to really save money you can get a refurb. Several of the refurb places will guarentee their drives for X number of years (X varies with the particular company), so they can really be the way to go.

Anyway, you will now have your hard disk. You bolt down the drive and host adaptor (you can drill some extra holes in the case, or use wire-ties or whatever), connect the two, plug in the power cords (the ICD comes with a little splitter which connects to a standard PC type power cord), hook up the DMA, and boot up. It is very simple, and is not easily botched up. You only need to pay attention to:

SCSI id jumpers set to some reasonable value
SCSI terminator pack plugged into the drive
SCSI connector from drive to DMA is right side up on both ends
Nothing wiggling around

The first two can be checked via the manual that will accompany the drive (make sure you ask for one, some places assume you already have one), usually a 1 page Xerox. The third can be verified by checking that the red wire side of the ribbon cable is near pin one (which is marked on the board either by a number or by a square solder hole instead of a round one). If the cable is in backwards, the red end will be at the other end of the connection (quite often it is pin 2 that is marked, but you only need to know which end of the connector the numbers start on, and match it with the red wire). These

are the only two possibilities. You cannot mess up the power connections or the DMA connection (they won't go in wrong).

The reason you wanted a dual drive cable is so you can easily add another device in the future. You merely have to plug it into the other receptacle on the cable, remove the terminating resistor pack off the middle drive on the cable (the one on the plug closer to the computer), and check to see that the SCSI id jumpers are set to two different numbers. Oh, by the way, the ICD supports the Syquest SQ555 (the 44mb removeable cartridge drive) without any special concerns. Since the Syquest is a SCSI device, you can hook one of these up just a easily as you could a regular fixed disk drive. These only cost about $320 bucks nowadays, with 44mb cartridges going for ~$60.

It really is easy, and there are plenty of computer tinkerers around to look over your shoulder and verify what you do. You can also use a setup consisting of a host adaptor, SCSI controller board, and ordinary PC type hard disks, but you add complexity to the system and lose performance this way. Straight SCSI is much cleaner, and usually much faster (SCSI devices have their controller boards "built in", comunicating with the SCSI standard).

If you do get a hard disk, you should immediately buy Neodesk 3 and the Universal Item Selector III. They will make life much nicer. Also, beware of buying too small a hard disk. Megabytes are like potato chips. I have a buddy with a 105mb quantum drive, a 320mb Hitachi, and a Syquest SQ555 with 6 cartridges all hooked to his ST, and he still complains about not having enough disk space! I have not yet gone that apeshit, but I think Mr. Visa might have to talk to Syquest Corp. pretty soon. Oh, notice the my friend above has three SCSI devices hooked to his ICD. This just requires a 3 plug cable. The ICD can support 8 SCSI devices, and you can hook up multiple host adaptors if you really need to (like if you get given a box of 10mb SCSI drives :-).

Please feel free to email questions. The above is IMHO, direct flames elsewhere.

If you read German, you might want to go for TurboAss, a very good PD (or
Shareware, I cannot recall) assembler/debugger. If not, I hear DevPac2 is
the cream of the ST crop in commercial assemblers.

3035. Making the screen one line shorter (at the bottom) -- How?

Newsgroup: comp.sys.atari.st
Date: 1992-03-27 09:00:34 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <NVeaiB1w164w@ersys.edmonton.ab.ca>
Source record: 224236
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi. I wrote a terminal program for the ST a while back called DataLink. I am now re-writing it (still in Personal Pascal) and I would like to improve it. One of the improvements I would like to make is a status bar at the bottom of the terminal screen that shows information about what the program is doing, how it is set up, time online, etc. There are two ways I could do this:

1. Keep track of the incomming data, and actually scroll the screen myself when the data reaches the bottom. This is not the preferred way since it would slow the system down and waste program space and memory.

2. Convince the system that the screen is one line shorter than it actually is. I've seen this done, but do not know how to do it. This has the advantage of not wasting code, not slowing down the system, and not flickering. I need to know how to do this using system calls (BIOS, XBIOS, AES, VDI, or whatever it takes.) Personal Pascal doesn't provide internal support for aline calls, though (which I have heard have something to do with it) so I would have to find a way around that.

Thanks for any help offered.

> ==

With MiNT 0.92 you could use it without diffuculties; calling neoload.prg was enough.
With MiNT 0.93 must must use a cheap trick:

- put mint.prg in your auto folder
- put neoload.prg in your auto folder (physically before MiNT!!!)
- put mint.cnf, mintshel.rc, mintshel.prg, gem.prg at c:\
- the last line in mint.cnf must be:
INIT=gem.prg
- in your desktop.inf/newdesk.inf, you initialize
mintshel.prg
to be autostarted after GEM is present
- in mintshel.rc, the last lines must be:
cd c:\neo3
neodesk.exe

This starts NeoDesk as application under MiNT; it can be looked at as a process at u:\proc\neodesk.xxx (xxx = pid).

File selectors mmust also be loaded via mintshel.rc because MiNT steals something away from TOS wich disables file selectors which were loaded as TSR in the auto folder.

Mail me if you got difficulties.

At my system, I am even able to start other mintshels, shells in bgacc *and* GEM programs at the same time!!!

MiNT is great!

> farther up the line) is not registering the rotation of the disk! I am
> experiencing symptoms like only bing able to move up/left/right (not down)
> or not being able to move verticaly at all (neither up nor down). The

I never saw this in the FAQ, but I had this problem myself. In my mouse,
it was a badly soldered pin on the SMD chip inside the mouse that had broken
loose from the PCB board. After resoldering it, the mouse worked like a charm.
I could also imagine the following causes giving the same symptoms:

- broken LED or optical detector
- broken conductor lines (what's the ENglish term for this ?) on the
PCB
- broken wires in the cable.

I suggest you go over the whole PCB carefully, with a magnifying glass ...

Jens.

>Bob Malay

It looks as though I just got lucky with my upgrade to TOS 2.06!
My 1.6 and 2.06 tos versions were both the same type (32 pin type 27C010A)
Here follows the jumper settings for other ROM/EPROM types:
From the STE Computer Field Service Manual (C302481-001 REV A Aug 91)

ROM Jumper settings:

ROM/EPROM Part type W102 W103 W104
27256 Don't care 1 and 2 N/C
27512 2 and 3 2 and 3 N/C
571001/27C1000/531000 2 and 3 2 and 3 2 and 3 (the default setting)
27010/571000/27C1001 1 and 2 2 and 3 1 and 2

The jumpers are located next to the HI eprom

W104 W103
1-2-3 1-2-3

```
----------------. W102
1 | 1-2-3
|
-
HI |
-
|
|
----------------
```

Hope this helps

I would say that it is still correct. Having not used XCONTROL.ACC I am not certain but the TOS versions have some times been used interchangeably such as TOS 1.4 Rainbow is TOS 1.04 and same as TOS 1.02. I would say that it is wrong to quote TOS versions in this way, but it happens . . ..

3043. ftp -> atari via pc clone: How ?

Newsgroup: comp.sys.atari.st
Date: 1992-03-27 13:33:04 UTC
From: skershaw@loki.une.edu.au
Message-ID: <2396@loki.une.edu.au>
Source record: 224244
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi Guys and Gals,

I've spent the last two days ftp'ing stuff onto our unix (ultrix actually) machine here at une and then copied the files across to atari formatted discs inserted into a pc clone. I took them home to my atari (mega2st) and tried to un-arc them and my version of arc didn't want to know about them. I think I have v5.0 (or there abouts).

The question is, is there anything that I may not be doing or that I may be doing wrong (I am setting all the various file types for transfer to binary, could this be the problem?)?

e-mail responses gratefully accepted although I do read these groups regurlarly.

Thanks again,

Shane.

In article <1992Mar27.050010.25435@csi.uottawa.ca> cbbrowne@csi.uottawa.ca (Cristopher Brown) writes:
> There's been a LOT of talk about MultiTeX, most of it being fairly vague
> on availability and pricing. Could we get some hard data to work with?

Ok, here are some facts:
No longer PD, price 75.-DM.
(If you already ordered the PD-version from MAXON, the price reduces to 60.-DM. In this case you have to include the old MAXON-PD-Disk #390.)
Distributor: MAXON Computer, Schwalbacher Str.52, W-6236 Eschborn, Germany
Tel.: +49 6196/481811 Fax: +49 6196/41885
For orders from foreign countries you have to pay in advance, shipping is included.

There is no brief readme, so I may give some items on the differences to the old CS-TeX, which was PD:
- supports a limited multitasking provided by MultiGEM (not included, saled seperately for 159.-DM from the same distributor, lower prices [<130.-DM] from other distributors). Offers parallelism of preview and editing or printing or ``TeXing''.
- runs on every (monochrome?) platform (ST,STe,TT, arbitrary resolutions)
- special TT versions supporting FPU included.
- customizing of the large version of TeX possible.
- multitude of printers supported (9pin, 24pin, 48? inkjet, Laserjet, Laserjet II, Deskjet(+/500), Sharp JX LaserPrinter, Atari SLM, Postscript, file)
- new graphics commands (CSG Level 2) including Bezier-curves of order 2 and 3, circles, elliptical arcs, filled circles and elliptic arcs, adjusting of line thickness. (IMG, GEM and for Postscript-drivers EPSF supported as before).
- no support of fontlibraries or NFSS
- shipped with mEmacs and a GEM-based shareware editor capable of folding.

My personal experiences:
For an effective multitasking the old ST is too slow, and the resolution of the good ol' SM124 too poor. The offered multitasking reduces to a parallel preview of, say, complex formulas with typos of the syntax in it and the editing of the approriate passage in the sources. But this may be completely different on a TT and a screen-resolution of 1280*960.
Nearly all other virtues (and some disadvantages) remain as before.

Hope these information will brighten up things a little

3045. Need help with new 1040STe

Newsgroup: comp.sys.atari.st
Date: 1992-03-27 14:56:34 UTC
From: automan@milton.u.washington.edu
Message-ID: <1992Mar27.145634.29817@u.washington.edu>
Source record: 224246
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear Net-Gods:

I have been following most of the threads here for the last several months. Even though I have owned an Atari ST now since it was first introduced, I have recently purchased a 1040STe. At the moment, it is merely a STOCK machine, but I have had a few problems/questions. If these are FAQs, please bear with me:

#1. I have some trouble running older entertainment type software on this new system (ie. StarGlider). For some reason, it will not go any further than the opening screen. The version of TOS is unknown to me except that I am sure it is "Rainbow TOS". I have yet had the time to experiment with many other titles but was wondering if this is normal and if so, if there is a quick fix.

#2. Some of the files I have FTP'ed and then downladed have an extension of TAR.Z. All references I can find in UNIX on this describe it as a tape utility. How can I uncompress this?

#3. I am considering obtaining the necessary hardware to allow my ST to run IBM software. I have considered the following items:
-PC Ditto II (quoted at $199)
-Spectre (quoted at $299)
-Turbo Charger? (quoted at $500)

If anyone could comment on thier experiences with these items, or better prices and where I might obtain them, please let me know. Also, am not familiar with the features peculiar to each item.

#4. (Lengthy, ain't I?) I have a HP-48sx calculator and would like to be able to transfer programs to it via a cable. Those have this model calculator and an ST probably know what I am talking about. I have the cable, but am still having problems. Can you recommend a kermit package, etc? Any help would be appreciated.

Well, that's it for now (I know, most of you are thinking "THANK GOD!). I thank you for your help in advance.

Correct me if I am wrong but, from what I have been told, TOS 1.02 and TOS 1.2 are the same, TOS 1.04 and TOS 1.4 are the same, and (I assume) TOS 1.06 and TOS 1.6 are the same. This confused me also for awhile, and I still haven't found out why they are all referred to with different numbers!

Atari Mega ST4: TOS 1.2. In excellent condition, works great!
Has socketed 68000, for easy addition of an accelerator or other
mods. Asking $450 or makee offer.

If interested, please email me or call me voice at 804-971-6919.
Please leave a message on my machine if I'm not around. Thanks!

Rob

3052. Mouse/Joystick switch for ST

Newsgroup: comp.sys.atari.st
Date: 1992-03-27 17:14:26 UTC
From: bb693@cleveland.Freenet.Edu
Message-ID: <1992Mar27.171426.14173@usenet.ins.cwru.edu>
Source record: 224152

Like all students, I need some cash, and like all (?) Atari users, I have to cope with Atari's stupidity in locating the joy/mouse ports. Having solved this problem myself by building my own switch, I would like to start making and selling this switch. I will fully guarantee my product or I will replace it for you for free. But before I start buying the necessary components, I would like to get a rough idea of the potential market. At a VERY rough estimate I will offer the switch at a price of $9.00-$11.00, plus shipping. But as I said this is a rough estimate and may go up or down slightly Please e-mail me to tell me if you're interested, BUT NOT TO ORDER, for now I just need to know how many people are interested.

The switch I envision connects to the mouse/joy port, with about 12-16 inches of 9-wire cable which goes into a small box which holds the switch and two sockets, one for the mouse and the other for the joystick. I will be using 9-wire cable, so theoritically the switch should work with other devices connected to the ports, but i will NOT guarantee that, since I have tested it only with a mouse and a joystick.
However, if anyone would like some other configuration, such as more sockets, I can do that too, but I will have to get back to you about the price since a different configuration would cost me a different amount.

Later!

3053. Re: TOS 2.06 Upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-03-27 17:40:28 UTC
From: baffoni@aludra.usc.edu
Message-ID: <kt6ngcINNdna@aludra.usc.edu>
Source record: 224153

You know, if you decide to de-solder the ROMs, you might want to go out and buy a nice low-impedence (high quality), low-profile socket so that you can still install 2.06 by "plug-N-go", and when Multi-TOS (or whatever the latest-greatest ROMs are that) comes out, you won't have as many headaches (or oportunities to trash your computer).

3054. Networking software for ST

From: pm@fortec.tuwien.ac.at
Message-ID: <pm.701722127@fortec.tuwien.ac.at>
Source record: 224154

Hello,

some time ago we purchased a "Riebl-Card plus" ethernet card from Atari
to connect our Mega-ST to our LAN.
As we couldn't find convenient software to communicate to our Suns we
started to write our own. Meanwhile we have adapted it to be compatible
to the Atari ANS TCP/IP specifications.

Our software package currently includes
- a multi window telnet program
- a ftp server program, both useable as .ACC or .PRG
- an ANS compatible TCP/IP protocol stack
- an ethernet driver for Atari Riebl-Card plus

Anybody interested in this stuff drop me a mail.

For my communications system, I wrote my own screen driver in C for managing windows. Works fine with a stripped down TOS 1.0 machine.

Actually, with all the rig a marole' TOS 1.0 text output is bad, but not bad enough to resort to ASM for serial applications.

Its also quite portable between TOS's too.

If you would like a discussion on it, email me.

I might even be gracious enough to show you how to do ANSI.

>
>2. Convince the system that the screen is one line shorter than it
>actually is. I've seen this done, but do not know how to do it. This

>internal support for aline calls, though (which I have heard have
>something to do with it) so I would have to find a way around that.

You could write a Vblank driver...but why? By the time you do that, you could already have your own screen driver, which you are going to have to write anyway if you want to support more than VT52, which if you don't would make your terminal program kinda boring. Take a VACATION if you want to do it in assembly language using VBLANK drivers...

Trust me, its not as bad as it sounds.

PASCAL is NOT the way to go though in trying to do this. If you don't know C, learn it quickly. Or, learn 68K assembly and stick with PASCAL if thats your schtick.

C does make your life easier though....at least in this case...:).

SLIP itself is not the problem ... you can program that at one evening. But
you need programs that manage IP packets. Have you seen any telnet implemen-
tation for the ST yet? :-) :-)

Small correction: Atari, MSDOS, and other machines use a CR/LF pair as the line separator in text files, whereas unix uses just an LF (a "newline"). What you want to do is strip the CR from your uploaded files, not the LF. The easiest way to do it is on the unix side:

```
tr -d '\015' <infile >outfile
```

Check the man page for ``tr'' for details. (BTW, this should only be necessary if you want to view or edit the postscript file; your postscript printer/interpreter shouldn't care whether there are CR's in the file.)

From the Holy Book of <kt3s7rINNgo@sahara.cs.utexas.edu>
as spake by psurge@cs.utexas.edu (Troy Carpenter) :
> [...] Is there any way, either on the UNIX or ST side of the
>process where I can strip the line feeds from a text file.

Check on the Unix end for a program called `tr'. The command
`tr -d \015 <yourfile >yourfile.1' will create a new copy of your file with no
carriage returns (which is what I think you actually want -- most Unixes use
line-feeds as the end-of-line marker). As always, `man tr' will get you more
information.

3064. Warp 9 (CodeHead's Quick ST!)

Newsgroup: comp.sys.atari.st
Date: 1992-03-28 07:15:24 UTC
From: as666@cleveland.Freenet.Edu
Message-ID: <1992Mar28.071524.25919@usenet.ins.cwru.edu>
Source record: 224164

```
For immediate release
CodeHeadQuarters
Friday, March 27, 1992
----------------------

You Knew It As Quick ST...

You'll LOVE It As...

WARP 9 - THE SOFTWARE ACCELERATOR!

HOLLYWOOD, CALIFORNIA - CodeHead Technologies is proud to announce the
release of its brand new software accelerator -- Warp 9!

On January 1, 1992 we took over support and development of the popular
Quick ST screen accelerator from Branch Always Software. It's taken over
three months to complete the modifications necessary to turn it into a
CodeHead product, but it's well worth the wait. The resulting fruit of
our labors is Warp 9 -- the fastest, most compatible software
graphics/text accelerator _ever_ for the Atari line of computers!

We've decided to give it this new name because it's changed so dramatically
that it's hardly even recognizable anymore. The only similarity between
Warp 9 and its predecessor, Quick ST, is incredible speed!

Although Warp 9 has a completely new user interface and many new features,
the major benefit over previous screen accelerators is COMPATIBILITY!
Literally dozens of bugs and compatibility problems have been eradicated
in Warp 9. It now works fine with FSM GDOS, and problems have been
eliminated with Touch-Up, PageStream, and many other programs where redraw
and other problems existed. Warp 9 also works fine on the TT, and
accelerates the graphics of TT Medium resolution remarkably.

What IS a Software Screen Accelerator?
--------------------------------------

Warp 9 operates by intercepting operating system calls. Most of the
normal operating system calls are not written with the utmost efficiency
as far as speed is concerned. Warp 9 uses highly optimized assembly
language routines which can give you speed increases of 400% all the way
up to 1200% or more. That's from 4 to 12 times faster! The difference is
immediately noticable in almost every area of your computer activities.
Text, graphics, and windows virtually fly onto the screen. Once you try
using Warp 9, you'll never allow yourself to operate without it again.

New Features:
---------------
```

The user interface of Warp 9 has been completely revamped. The Warp 9 program installs in the AUTO folder, giving increased speed to the loading of your AUTO programs. The effectiveness of a software accelerator is normally diminished by the additional overhead of other resident programs installed in your system. But Warp 9 uses a special trick to avoid this problem. The Warp 9 Control Panel accessory communicates with Warp 9, telling it to reinstall itself, giving it a prime position for acceleration. If you want to save memory by not installing the Warp 9 Control Panel, you can auto-run our QuickGrab program which will provide the same function. This gives you the best of both worlds, the utmost in speed during the bootup process as well as at the desktop level and in your applications.

Besides speed and compatibility, Warp 9 offers you all of the same features available in Quick ST and much more. You can replace the system screen font with one of your own, or choose from any of the 6 dozen fonts included with Warp 9. You can also change the system fill patterns, altering the look of your windows and dialog boxes. You can change the desktop's background pattern by using a custom fill pattern or even load a picture in any resolution, including the TT resolutions. Warp 9 can load pictures in many formats, including PI1, PI2, PI3, PC1, PC2, PC3, TNY, TN1, TN2, TN3, and PNT. The font, fills, and background pictures can be configured to load automatically when you boot up. Fonts and fill patterns can be edited by using the included Customizer program.

There's also a completely configurable mouse accelerator built right into Warp 9. You can tailor the acceleration to your own needs, or choose from one of the four preset configurations available. Other optional mouse features include "blocking" to keep the mouse from accidentally entering the menu bar area, "jumping" to force the mouse to the menu bar at the click of the right mouse button, and separately configurable horizontal and vertical wrap-around of the mouse when it reaches the edge of the screen.

Warp 9 also includes the functionality of FunkAlert, the shareware program by Charles F. Johnson. This gives you the ability to select any button in any standard alert box by the simple press of a function key. You can turn off the system Zoom Boxes, too, for even more speed. A well-written 50-page manual gives detailed instructions for using every facet of Warp 9.

Order Warp 9 today...you just can't get a faster, more compatible screen accelerator for your Atari computer, and you also receive the quality and support for which CodeHead Technologies is famous.

Availability

Warp 9 will be shipping as of Monday, March 30th. Retail price is $44.95. Contact your local dealer or order directly from CodeHead Technologies at the address below. Mastercard, Visa, and American Express credit cards are accepted. For shipping, add $3 US, $4 Canada, and $6 overseas.

Owners of any version of Quick ST or Turbo ST can purchase Warp 9 for only
$20 by returning their original disk with payment to:

Some German outfit makes a HD-MODUL that either attaches to the disk
controller chip or replaces it, and then allows a 720K drive to be replaced
by a 1.44M drive. I think Toad Computers has this module for sale for about
$60.

I use a trick that jwahar bammi (bammi@cadence.com (rather old address) or 71515.155@compuserve.com) posted many years ago which changes the total lines the system sees by altering a value in the aline structure. This is likely not legal, but it has worked for me ��without problems on a ST. I don't have the code handy but believe the value is V_CEL_MY in the aline.h file he distributed (max Y cells -1).

Hello, well that other person is me...

Again, my tape driver is based upon Paul Moreau's code, although I have already posted my TapeBIOS driver to comp.binaries. Included is full docs, programmer's docs, library code, include files , sample code for dumping drives to tape, restoring them etc. and I've also just posted my port of GNU Tar v1.10 too, which has support for my TapeBIOS driver.

3070. Will US accessories work in Germany?

Newsgroup: comp.sys.atari.st
Date: 1992-03-28 20:07:13 UTC
From: CLARK@SALK-SC2.SDSC.EDU
Message-ID: <9203282005.AA03639@ucbvax.Berkeley.EDU>
Source record: 224170

Hi,

A friend from Germany is wondering if a Spectre GCR purchased here in the US will work on her Mega ST back in Germany. Does anyone know if there would be any problems, such as with keyboard mappings, or anything else? Also, is it worthwhile to get an external hard drive here to take to Germany? Obviously a transformer will be needed or the power supply will have to be changed, but are the drives here cheap enough (compared to Germany) to make it worth the trouble? For example, Toad Computers in Maryland sells a 52Meg Quantum drive (12 ms access, ICD adaptor, clock, monitor style case and room for a second drive) for just under US$500.

Any advice or suggestions would be much appreciated.

Rgds,

Steve Clark

>

I do. I'd love to have a CD-ROM player hooked up to a computer. I was really hoping to get one for my ST some day, but now it looks like that won't happen. I don't want to do what Joe Waters, editor of Current Notes, said he did in the March '92 issue...namely, buy a 1meg 286-msdos machine with a built in cd-rom player for around $1000. I also don't want to go mucking around with getting a made-for-msdos-cd-rom player, which can work with text on an ST...but may have problems with things like VGA graphics. I imagine there are others in the ST world who would be interested in having a cd-rom player for their ST if there were reasonable cds that could be used on their machine.

>
>Bob Malay
>
Just out of curiousity, Bob, are the disks you want to use
this on formatted as purely Mac disks? I don't have
AutoDouble (or any compression program for the Mac, other than
BackUp that comes with MacTools Delux)...but I recall that in
order to use disk fixers like MacTools, the disk has to be
formatted by the Mac OS before these Mac programs will work on
them.
To put it in other words...disks must be formatted while in
Mac mode by the Mac os, not simply by the GCR formatter.
Good luck,
--Gerry
PS. I would hope these things work!

Try the following:

tr -d \\015 < infile > outfile

It is working on the UNIX side and if you have a tr for the ST (I have) than
you can do it also on the ST side.

>Thanks,

> Troy Carpenter

Hope that helps,

I agree it is a great article,.
What is missing for me is a side-bar giving a step-by-step ftp session
with the archive. I have not figured out how to do it yet. It is apparently
so simple that, for those who know, it does not seem worth mentioning. BasicallyI am not
fluent in ftp. After logging on as "anonymous" I am lost. If someone
could post 1 or 2 step-by-steps to get a listing of files and to do a download, I would
appreciate it.

Just too dumb.
If you think it is too obvious for everyone else, please respond by e-mail.

Thanks, Bob komives

3075. Flaky 750-K disc drive

Newsgroup: comp.sys.atari.st
Date: 1992-03-29 03:56:48 UTC
From: v_white@xraylith.wisc.edu
Message-ID: <1992Mar29.035648.19024@xraylith.wisc.edu>
Source record: 224175

Friends,
I have a very old 520 st whose disc drive took a long decline,
and finally reached the point where it eats a disc every
time I use it. I opened it up and it seems that the head
grinds into the disc, and I get all sorts of interesting
errors as it struggles to read the disc. I saw no simple
head adjustment screws, and so it's out of my league.
Figuring a new drive is probably a viable approach to the problem
and living in an Atari backwater area, I have a few questions about
the problem:

Questions:
1) Is this a typical problem of the SF-314?
2) Where is the best place to pick up a replacement?
3) Is there any hope of getting a 2.88 Meg drive
that can still read my undestroyed floppys?

Thanks in advance,

Victor White

Don't expect the Falcon STE to run at 50 MHz. That would be competing with
the next generation of TT.

>Looks like to me the '030 add-on industry is going to be short-lived - just my
>opinion.

There are a lot of 1040's 520's and old Megas out there. Do you really expect
them to be thrown away when they can be upgraded for a reasonable price?

Some ST users told me that more developers would be getting a new
shipment of Falcons(??) sometime in April and be in the stores
around fall this year. At least they said Lenard Tramiel
said that last week. Did anyone hear or read that too and
have more info? Anyone at Atari here and can at least
tell us what Tramiel said is true? I got a lotta questions in
email from people wanting to know more about the Falcon so
could anyone tell us more please!??

3078. New X*Press X*Change Mailing List

Newsgroup: comp.sys.atari.st
Date: 1992-03-29 04:32:52 UTC
From: xpress-sub@undr.org
Message-ID: <1992Mar28.937006.NQO9s@undr.org>
Source record: 224178
Cross-posted to: comp.sys.mac.misc,comp.sys.amiga,comp.sys.amiga.datacomm,comp.sys.atari.st

Over the past few weeks, some discussion has occured in rec.video.satellite regarding the little-known news system called X*Press X*Change, A world news [UPI/AP/NOT USENET] transfer system that is delivered via cable TV (see explanation at end). The X*Press company has software for the IBM PC, Mac, Amiga, and Atari ST. A mailing list has been set up to discuss the following items:

o The X*Press Service, In General

o What can be done to improve the service

o What can be done to improve the software package (*)

o Tips, Hints, etc. regarding the service and software

o Anything which relates to X*Press X*Change

(*) This list may be of special interest to programmers who are interested in helping develop a new software package for the IBM PC which will include the bare necessities which X*Press left out. Should you be interested in helping, please, let us know.

The following is an edited review of the X*Press X*Change service and software by Gary Bourgois, it helps to explain what this service is all about:

X*PRESS X*CHANGE is a very interesting and fun system that brings you access to a LOT of the worlds newswires direct from space to your computer (or over CATV Cable). It has it's own messaging system, and also has GREEN NET and other selected network conferences (no nothing from USENET). The system has great potential to provide some really useful information for those willing to babysit it. Just having the evenings TV schedule helped me find a couple things I had overlooked in the (messy) cableguide. (They also give ME/U schedules and C/SPAN schedules, Soap Opera capsules, and best viewing bets for primetime). I learned about the Earthquake in Turkey over X*press X*change even though I had my radio on. I got the 7PM Associated Press newsfeed at 7:14PM.

Their premium service includes a stock ticker and personal portfolio from Standard and Poors. Any Businessman worth his salt should have this service. This requires an additional module, and subscription.

For cable subscribers, X*X* is included in the basic cable monthly fee, you pay NOTHING for access to the data. This is why they don't want you "sharing" the information you receive on your screen with anyone. It is amazing to have all this stuff coming in and not having to pay a huge fee for

it.

X*PRESS X*CHANGE is worth the price of admission. I paid more than that for my first 300 baud modem.

Check it out! If you have a dish, or if your cable company has the datastream present (many many of them do) You can get your own X*X* box by getting out your hunk of plastic and calling: 1-800-7-PC-NEWS. If you get Mike Buel, you will find a nice helpful person on the other end who will answer your questions and see you get the box, and cables that will work for you.

If you are interested in subscribing to the list, send mail to:

xpress-sub@undr.org

Include a good mail address with that message.

This list will run for a period of 2 weeks, at which time it will be evaluated to see if there is enough interest. The founders of the list are mostly looking to get suggestions for items the users of X*Change would like to see in the software package, but the list is open to all discussions/questions relating to the package.

3079. sigfonts

Newsgroup: comp.sys.atari.st
Date: 1992-03-29 05:15:10 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1992Mar29.051510.5683@csi.uottawa.ca>
Source record: 224179

Small question:
A file was just put up on the archive at University of Michigan, called "sigfntdj.zoo". It contains various files that are placed in a directory called "sigfonts".

I'm guessing that these are some sort of fonts, designed for the HP DeskJet printer. Just what are they useful for? (Or are these fonts for Calamus or something of the sort, and are obvious to the people with the software for which they would be useful, and say nothing to those of us who have no reason to need 'em?)

Inquiring minds want to know...

I posted this on Comp_sys_atari..Tech and now bring it to you in living black and white!

Atari ST's are almost dead in this country, New Zealand, and I would be interested to see how the worldwide picture is, so far(See st_Tech)Germany seems about the only country expecting great things, how goes it elsewhere! I know IBM has problems and is quite difficult to program and the MAC is a PIG to program, so why is ATARI snuffing it? And why are ATARI'ists so loyal, the machine must have something going for it, other than the companies inability in marketing that is!

Ursulus

>found out why they are all referred to with different numbers!

It's simply because Atari changed the way the os_version field has to be
interpreted. Before TOS 1.04 was out, $0102 was said to mean '1.2' - then some
time they changed it, and since then it's '1.02' - same for all other versions
except 1.0

3089. Math symbols in FSM-GDOS?

Newsgroup: comp.sys.atari.st
Date: 1992-03-30 00:20:07 UTC
From: yegerleh@magellan.ecn.purdue.edu
Message-ID: <1992Mar30.002007.6377@noose.ecn.purdue.edu>
Source record: 224189

Hello everyone,
Can someone who uses FSM-GDOS say if it supports math symbols such as greek letters, less-than-or-equal-to symbols, integrals, etc. ? Does it have a separate font called "symbols" or something similar, or does each of the symbols already exist in each font? That is, does the times-roman font already have a symbol for theta in it?

If FSM-GDOS doesn't support math symbols, doesn't that imply that Word-Flair II does not support any math symbols?

I recently wrote a paper for an academic journal using Pagestream, and the absence of these characters in Pagestream's fonts was a major nuisance. If FSM-GDOS doesn't support these symbols, can anyone name a word-processor that does (besides TeX, of which I am already aware).

Thanks,
Jim

What would come after version 1.9 ? 1.10 ? That's why the REAL version
number is written like "1.04", but spoken as "1 point 4". after 1.9 would
come "1 point 10". Check out the version number of emacs sometime:

18.58.1

3095. Ataris in Europe

Newsgroup: comp.sys.atari.st
Date: 1992-03-30 04:16:15 UTC
From: trag@pnet01.cts.com
Message-ID: <1992Mar30.041615.17861@crash.cts.com>
Source record: 224195

Greetings from San Diego, Calif.,

I'm doing a story on Amiga and Atari computers' market share outside the United States; specifically in Europe. I'm interested in observations, opinions, facts, figures and just plain ruminations from Atari/Amiga users in Europe. As a U.S. user, I'm unfamiliar with the set-ups of the Atari and Amiga computers sold in Europe, particularly as we hear that both machines are popular due to their Unix capabilities. Any information on non-icon desktop OSs on Amiga and Atari is greatly appreciated. Also, we in the U.S. hear that Ataris and Amigas are vastly more influential on the overall European computer scene than is true in our country. Again, any comments reflecting the accuracy/inaccuracy are appreciated.

The story will run in San Diego's ComputorEdge magazine in mid-May, and I will e-mail an ASCII copy of it to all who respond (as well as the general conversation groups, if an interest is noted.)

If those in Japan, Latin America and Australia/New Zealand wish to respond as well, it would make an interesting sidenote to the situation in Europe. Too, C-64 and Atari 400/800/XL/XE users familiar with the role of those computers in their home countries should also respond if so inclined. All information on Atari and Commodore products is welcomed, and all responses will be likewise responded to.

Please e-mail all responses to the above address, and many, many thanks for your help, cooperation and loyalty to non-IBM platforms.

Why do people post such rubish, Atari has never stated that there is a Falcon
at all, if there ever was why was it not shown at Ce-Bit..

And what support will you ever get with any new such machine, again
NILL, go by a Acorn Archemides A5000 if you nead a Real Machine,
Atari is now DEAD..

3097. ST Fido BBS software - where?

Newsgroup: comp.sys.atari.st
Date: 1992-03-30 04:41:31 UTC
From: roberson@aurs01.uucp
Message-ID: <60493@aurs01.UUCP>
Source record: 224197

I just extracted the following list from the latest etion of FidoNews.
I am looking for the following information:

Which ones are Commercial and which ones are PD?
If commercial, how much?
If PD, where is it archived?
Is there a BBS that I can call to take a test drive?
Any recommendations?
Any with built-in UUCP support?

Thanks,
Chip

Forgive me if I am mistaken, but I thought this was the Atari ST support area. Oh.. I know what it is.. you are trying to sell that kind of computer.. try forsale.

Basicially, I like my atari. It isn't dead. If you don't like yours, well, hit q a few times...

Get the Mac Classic II with the educational discount. You'll be able to make most of the money back from the programming if you are getting paid.

Problems with GCR as Mac programming environment:

* Crashes. Crashes are common enough with regular (and irregular) programming environments, problems add up when you throw the Spectre into the mix.

* GCR will gobble up hard disk space.

* The Classic II is faster, for faster compiles etc.

Leonard Tramiel (Atari's VP of Software Dev.) prefaced his conference on GENIE with the remark that developers can expect to get their hands on a Falcon '030 in a couple of weeks. Developers like Lexicor (makers of 3D anim., render/painting, and keyframe animation software) got their machines earlier.

His exact statement follows:

```

March 25, 1992

<[Leonard] STRAMIEL>
As most of you know, at CeBIT in Hanover Atari previewed some exciting new
technology.

This technology allowed us to generate extremely high quality graphics and
sound simultaneously. The members of the press to which this was shown were
very impressed.

The first product to incorporate these new technologies will be available
at retail by late fall of 1992 and first developer units will be available
by the end of April. This product will have a 68030 as it's main
processor. As I'm sure you can appreciate, no further details will be
available until product release.

My First Word disk I got with my 1040 ST is toast....

When I call Atari about replacing it, they told me they no longer carry it.
Their only help was to refer me to B&C where I could BUY a copy for $9!

Does anyone know the makers of First Word? I'd like to see if they
could help me....

From: seelbach@lorien.fernuni-hagen.de
Message-ID: <7770@fuhainf.fernuni-hagen.de>
Source record: 224053

Hi there,

I want to enlarge the memory of a Mega STE from 1 to
4 MB. Is it sufficient to replace the "old" with the
"new" memory modules or are there some jumpers which
are to be changed? (There are 2 jumpers in front of the
memory module sockets but I don't know their function.)

Many thanks in advance,

W. Seelbach

Sorry, but the Falcon **WAS** shown at the CeBIT: I read in my (Dutch)
Atari-magazine an article with the following info:
Introduced to the press the Atari Falcon 030 by Jack Tramiel
68030 processor
16 MHz up to 50 MHz clock speed
1.44 MB Floppy
True Color (16.7 Million colors)
Any monitor can be attached: SM 124, SM 1224, (S-)VGA
16-bit stereo sound
microphone input

Delivered to developers: expected in May 1992
First production-machines expected at the end of summer 1992
Probably exposed at Atari Messe Duesseldorf Germany in August
Available to dealers expected in fall 1992

Rumors about the price: Dfl 1500 up (US$ 850)

About one year ago, a mail server was announced.

To use the server, send a one line message to

atari@atari.archive.umich.edu

Your message should contain just the word "help" (no leading blanks, no quotes).

What provision is there for Gem programs that use the entire screen but without windows? I have a program that needs the full 640*400 of a mono screen, so for the most part it does not have a menu bar/window gadgets. Running under Mint, I can background it with ^Z but I don't see that working too well on the desktop. Will there be some sort of send window/application to back function?

3107. quick-and-dirty FTP guide

Newsgroup: comp.sys.atari.st
Date: 1992-03-30 10:59:30 UTC
From: davidli@lapis.labmed.umn.edu
Message-ID: <1992Mar30.105930.1@lapis.labmed.umn.edu>
Source record: 224057

For those who requested it, here is a 'quick-and-dirty' introduction to
using FTP to obtain files from the atari.archive server.

First, enter the proper FTP command:

```
% ftp atari.archive.umich.edu
or
% ftp 141.211.164.8
```

Note: the second format is for those brain-dead systems which don't have
access to a DOMAIN NAME SERVER. Use the first form of the command
if at all possible

You should receive a response after a brief period of time, which looks
something like this:

```
220 terminator.cc.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST
1991) ready.
ftp>
```

OK, now enter the following command at the 'ftp>' prompt:

```
ftp> user anonymous
```

You should receive a response which looks something like this:

```
331 Guest login ok, send ident as password.
Password:
```

So, enter your e-mail address at the 'Password:' prompt:

```
Password: myname@myhost.mydomain
```

You'll receive a response which looks like this:

```
230 Guest login ok, access restrictions apply.
ftp>
```

This indicates that you're 'in' -- you've made the connection. So, what
next?

Change the directory to the atari archives, using the command:

```
ftp> cd atari
```

You can get a directory listing using the command:

```
ftp> ls
or
ftp> dir
```

You can obtain a binary file using the following commands:

1. set FTP transfer to binary mode:

ftp> binary

(NOTE: on a VMS machine, the command may be 'set image' ...)

2. get the file in question:

ftp> get the_file.zoo

Last, but not least, quit the FTP session, using the command:

ftp> quit

Got it? Here's an example I did this morning:

```
DP-Z> ftp atari.archive.umich.edu
%FTP-I-ATTEMPTING, Attempting to connect to host ATARI.ARCHIVE.UMICH.EDU
220 terminator.cc.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST
1991) ready.
ftp> user anonymous
331 Guest login ok, send ident as password.
Password:
230 Guest login ok, access restrictions apply.
ftp> cd atari/newitems
250 CWD command successful.
ftp> dir
200 PORT command successful.
150 Opening data connection for /bin/ls (ascii mode) (0 bytes).
total 56
lrwxrwxrwx 1 atari ftp 23 Mar 24 10:43 89a_87a.lzh ->../graphics/89a_87a.lzh
lrwxrwxrwx 1 atari ftp 21 Mar 28 12:09 accomp24.zoo ->../music/accomp24.zoo
lrwxrwxrwx 1 atari ftp 22 Mar 24 10:45 ahdi5.zoo ->../diskutils/ahdi5.zoo
lrwxrwxrwx 1 atari ftp 21 Mar 24 10:41 anist.arc ->../graphics/anist.arc

... [STUFF DELETE HERE FOR BREVITY] ...

%FTP-I-DATA_RATE, Transferred 5425 bytes in 00:00:08.52 = 636 bytes/Second
ftp> binary
ftp> get accomp24.zoo
200 PORT command successful.
150 Opening data connection for accomp24.zoo (binary mode) (140311 bytes).
226 Transfer complete.
%FTP-I-DATA_RATE, Transferred 140311 bytes in 00:00:07.72 = 18175 bytes/Second
ftp> quit
221 Goodbye.
```

>games for this new system.

I guess this would depend on how different the Falcon is internally from ST's. If video and sound aren't too different / have backward compatibility modes I imagine developers would go for on a ``why not'' basis. After all, there are some TT's and quite a few accelerated / 16Mhz ST's around too (esp. in Germany) that would benefit from games capable of using a tad more CPU power. Stuff that fully exploits the new goodies would of course depend on eventual sales of 68030 based Atari's.

Incidentally, is there any ST literate out there who would care to post or mail a summary of the machine's spec. and likely delivery etc?

Message-ID: <1558@nikhefh.nikhef.nl>
Source record: 224059
Cross-posted to: comp.sys.atari.st,rec.games.video,rec.games.misc

Since people are doubting the Falcon and Atari so much, I just thought that
I would just say that I read in Atari ST Nieuws that the Falcon was released
on the CeBit behind the screens, it was shown only to invited guests. So no
wonder I didn't see it.
It has: - a 68030 processor
- True Color
- Standard a HD drive
- It is prepared to take Multi TOS
- Works on 16Mhz for the cheapest model, up to 50Mhz for the
most expensive model.
- And a some more things, but I can't remeber now.

The first production models will be shown to the public on the Atari Messe in
Dusseldorf (21 to 23 August). It wouldbe available in Holland about October
this year.
Price? HLF 1500,-. That would be 800 to 900 US Dollars. 1500 guilders is
about the same price as an Amiga 500 with monitor in Holland.

If anyone doubts that the Falcon will be shown on the Atari Messe, go there
for yourself! Talk to some people from Atari for yourself, in stead of
starting a flame war on the Net !

SEE YA!

I am looking for an auto folder program called turbocts.prg. It basically "fixes" hardware flow control in TOS for use with 9600 baud and greater modems (to my understanding). Now that I have such a beast, I would like the program (I had it at some point, and got rid of it :-( ). It is pd or shareware.

If you have any pointers to this program, please email or post. I asked about this once before and got zero response.

Thanks in advance.

Hi all netters!

I am looking for a new software for the BBS our user club (ST-Klubi
ry, a national Atari user club in Finland) maintains.

It is currently running on a Mega 4 with Michtron and has 3 lines.

The main requirements for the software are multi-line support and
possible TT-compatibility, also programmable features are wished.

It would be good if it is PD, FW, SW or something like that, but
commercial software is also accepted, if it is what we need and good
value.

So if anybody knows anything woth checking out, please let me know. An
info accepted.

If there is something that runs under MiNT, it is also accepted.

From: samm@aisb.ed.ac.uk
Message-ID: <1992Mar30.130447.18032@aisb.ed.ac.uk>
Source record: 224063

I have a copy of STOS which is about 2 years old, released just
after the original STE incompatability problems emerged. When I load it
into my STE it prints 'Tos 1.6' on the loading screen, but begins:
>division by zero error
OK
On the editor, and there is no mouse pointer. This didn't happen on my
STFM, so I guess there's still a compatability problem. Does anyone know
if STOS needs another patch to work with Tos 1.62, not just 1.6 ?

Thanks, Sam.

3115. Re: Ataries Future!!!!

Newsgroup: comp.sys.atari.st
Date: 1992-03-30 15:22:29 UTC
From: saj@chinet.chi.il.us
Message-ID: <1992Mar30.152229.17538@chinet.chi.il.us>
Source record: 224064

What I can learn about Atari's prospects: Atari is making enough money that they are under no pressure to fold. Lynx is a huge success, and they're moving large numbers of Portfolios (although the reason has a lot to do with low price). There's sure to be a big demand for the Book when it first appears, although how long that lasts is an open question.

The whole ST/TT family is a bit mysterious. The machines have to be very inexpensive to make, so the unit profits would seem to be worthwhile, but the low volume doesn't leave me comfortable about the future.

Atari still shows a great deal more ability at designing 'gee-whiz-wouldn't - it-be-nice' hardware and software than at getting it to market in quantity. If they had something like the rumored 'Falcon' on sale this Summer, with MultiTOS, they could attack a number of interesting markets, but somehow I don't have much faith in that.

The wild card is their lawsuit against Nintendo. All the comment in the financial press has been along the lines of "Eithe side could win on the merits of the case, but this is a good time for a US company to have a suit tried against a Japanese company, in a US court". The stakes are large, relative to Atari's budget.

So Atari seems likely to last. The ST/TT line could go either way, though.

Steve saj@chinet.chi.il.us

3116. Re: Making the screen one line shorter (at the bottom) -- How?

Newsgroup: comp.sys.atari.st
Date: 1992-03-30 15:23:20 UTC
From: neil@cs.hw.ac.uk

Source record: 224065
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

You could use the Line-A to do this (I have done in the past) but to make the program compatible with the TT I wouldn't. I suggest you allocate some RAM for a screen + 1 text line + allignment. Use Setscreen to set the physical screen to show the last 25 lines but set the logical screen to point to the first 25 lines. That way the top 24 lines will be scrolled. When you want to alter the sysline set the logical screen to the last 25 lines, write to the last line then restore the logical screenbase to the first 25 lines again.

Source record: 224068

I just bought XBOOT - ordered it directly from Gribnif - this is a wonderful program and well worth the money. In just a matter of minutes I set up three "Sets" of (auto prgs, accs and init programs) by just pointing and clicking and my machine still had not completely "booted" yet!

Buy this program - support your ST!

Bob Malay

Craig.... a few of the differences..

1/ Keyboard layout
2/ timing for 60hz

We have both here US and UK machines. Both have US mapped keyboards.
If you up to the hack yourself all you have to do is change the
keyboard mapping with a $HEX editor in the proms.

I agree with Roger it would be better for you to get from the UK or
maybe drop a line to Atari-Oz and see if they have it yet.

I used KA9Q on my TNC (a paccomm 320) the other night. I was impressed.
I might add there is a fully compiled version on GEnie. Go to page 475
(the Atari RTC) select option 3 for files libary and then do a search
under 3 with the keyword of KA9Q and it will give you the file number.

>Get the Mac Classic II with the educational discount. You'll be able to make
>most of the money back from the programming if you are getting paid.

NO! Get the LC with the 020 while they are on sale, they are FASTER than the Classic II with the 030 (trust me on this one, we've run NUMEROUS speed comparisons), and can be had right now fo under $1200 with 4 megs ram, 40 meg hard drive, and color monitor. DO NOT buy the Classic II, it is a piece of shit, but a used SE/30 first, but ANYTHING before a Classic, they are a total ripoff!!!!!!!! The LC with the 020 is just as fast as the LC with the 030, I don't know why, leave it to apple..... :-(

>Problems with GCR as Mac programming environment:
>
>* Crashes. Crashes are common enough with regular (and irregular) programming
>environments, problems add up when you throw the Spectre into the mix.

The GCR is very stable, I would not worry about it. Also, if what you write crashed the GCR you will know you've done something wrong :-) We have SUBSTANTIALY more crashes with REAL MACS in our lab that I used to have with my GCR.

>* GCR will gobble up hard disk space.

True, you will need hard drive space, at least 20 megs probably, more for serious work...

>* The Classic II is faster, for faster compiles etc.

The Classis II may technically BE faster, but it sure as hell does not FEEL faster. Ask anyone who uses one, it is the most incredible dog of a computer I've ever used. Makes the GCR on an 8mhz 68000 look like a speed-demon, and with a cheap accelerator board (AdSpeed or T20/25) the GCR will seem so much faster than the Classic II you won't believe it! I don't know what the hell apple did to the Classic II, but I swear it feels slower to use the a MAC+. part of this is probably System 7, "the giant April fools joke" of operating systems. And you HAVE to run 7 on the Classic II, we tried the older systems and they won't work, as Apple promised... :-(

So, in short, DON'T buy a Classic II!

>That is, does the times-roman font already have a symbol for theta
>in it?

With FSM you can select two optionally fonts - symbol and hebrew(sp?).
These are commen to all the other fonts.

It is quite interesting to look at the FSM fonts with a file viewer, all
the letters in the font have names, there are ligatures(sp?) like ff.
I think that there are many more than 256 letters in the fonts...

>If FSM-GDOS doesn't support math symbols, doesn't that imply that

Dunno about that... but isn't there some option like VDI??? or something that requires GDOS to be loaded...maybe that uses them?

Anyway, onto the reason I replied to this.... Does the new version have colour? A half decent dialer? IBM Graphics? (Can I say that word here?! :-)

oh yeah, also, does it have ZModem? It mentions in the manual of the version i've got a copy of (but don't use) that he didn't implement Zmodem because there isn't much difference between that and Kermit... the only problem I have with that is that 99% of the local BBS's (& LD ones here!) don't have Kermit, but do have Zmodem.

Craig.

>GEMulator can't possibly work as advertised, and is really pretty
>much worthless?
>
Gee, sounds like you are are anxiously awaiting the GEMulator (not!), heh. Maybe you are one of the folks who got pissed off at Darek M's anti-ST comments when he first announced it, I know it rubbed me the wrong way. Of course, I could also perhaps understand what might have motivated him to say such things. It must be tough to put so much effort into programming for the ST and end up with relatively little company and user support. Guess the grass was much greener on the Intel side of the street. He must still have some fondness for the ST though, to come up with the GEMulator. Anyway, to the point. I remember reading early on in an announcement about GEMulator that it was supposed to run under a full 32-bit version of Windows. So, although I don't want to get into an arguement as to whether its a stupid idea or not - I would say that means that Rod's comments do -not- mean that the GEMulator can't possibly work as advertised, and is pretty much worthless. I don't know when 32-bit windows is going to be released. That v3.1 isn't it, is it? Maybe so, I don't keep up with PC stuff that well. Last I heard, developers had beta versions of it and some development tools for it. Anyway. Mark.....

David,

When you did your speed comparisons of the Classic II versus the 020LC, were they BOTH running 7.0.X? If the LC was running 6.0.X (7,8) then it's no wonder that it got the faster ratings as the 7.0 has a lot of overhead to deal with.
As to why Apple decided to get rid of the 020s, I am sure that it is cheaper to buy bulk 030s then to buy less 030s and then a few (expensive) 020s, even considering that the 020s are cheap because the are old. Besides, this way you get a PMMU, a (small) built-in cache, and I believe (not sure) that the 030 has optomized some of the instructions to make them a bit faster.

Just my $.0002 worth.

3137. Pure C in English?

>teh older TSs?

As far as I know, you should be able to just go to your local electronics store and get a socket with the same number of pins as there are holes on the motherboard, desolder the old ROM (and since if there are more pins on the new ROM, I would assume you have to desolder some filled-in holes on the Logic board), then solder in the new socket. This shouldn't be that hard to find as it doesn't need to be Atari-specific...
If you wan't both TOSs (old and new) for compatibility reasons, you might want to go with the Codehead TEC card so that you can have both (but this is more than just a socket).

3141. Stripping Text Files

Newsgroup: comp.sys.atari.st
Date: 1992-03-31 02:02:21 UTC
From: psurge@cs.utexas.edu
Message-ID: <ktfi1dINNhiu@sahara.cs.utexas.edu>
Source record: 224089

Originally I posted a message which asked how to strip "linefeeds" from text files. I have been corrected in that I want to strip "carriage returns" instead. Many people have provided many solutions, but the easiest one came from Bob Bright. I took his suggestion and created an alias to do the stripping. Here's the alias:

```
alias strip "tr -d '\015' < "
```

To actually strip a file I type:

```
strip oldfilie > newfile
```

It is quick and easy. Thanks to Bob for suggesting the use of tr.

3143. Re: Nintendo, Commodore, Atari Chaos?

Newsgroup: comp.sys.atari.st
Date: 1992-03-31 05:50:12 UTC
From: jyoung@isis.cs.du.edu
Message-ID: <1992Mar31.055012.15042@mnemosyne.cs.du.edu>
Source record: 224091
Cross-posted to: rec.games.video,comp.sys.atari.st,comp.sys.amiga.games,comp.sys.amiga.advocacy

The concern with the analysts on the financial news was that Commodores
head Irv Gould wouldn't give up his pet company without making it
hard on Nintendo, so he would do what other companies have done.
He would increase his debt so much that it would be unattractive
to buy it out (I don't know the technical term that describes that
tactic).

Other concerns with a "Nintendo-Dore" was that Nintendo was already
going to buy a baseball team and that Atari had something like
a 500(?) MILLION dollar lawsuit that was coming up and that the Sega
and Atari games were going to put the squeeze from to to bottom!
So if Nintendo ends up in a lengthy hostile fight like CNN did with
CBS, they would have to end up selling some divisionss to pay
for the debt they accumulated. Guess which divisions will be
broken up and sold if that happens?

One clue. It won't be Nintendo's.

3144. Falcon '030

Newsgroup: comp.sys.atari.st

Well, I have also gathered infos at the CeBit, and yesturday from Atari France regarding the Falcon. Here they are :

- 68030, 20 MHz.
- TT rez, with an extended 640*480 VGA rez in 256 colors amongst 64K or 16M.
- 56001 DSP from Motorola.
- At least 4 Mb memory
- No MultiTOS at start, but it is to be introduced.
- SCSI Hard disk.
- Maybe : New chips to achieve zooming and sprite animation in hardware.

The machine should have the look of a standard 520 ST, that is *NO* separate keyboard.

The Mega STE is bound to disappear (Sorry for those who bought one).

This new machine should be released by October in France. A prototype is going to arrive at Atari France next month (?). As soon as it is arrived, I'll try to take a picture and post it somewhere.

More infos :

TT is continued till 94 when it'll be replaced by the Falcon '040.

TOS 2.07 is still not fully debugged, and Atari is unsure it'll be released.

Well, enjoy,

Vincent.

This won't work with most add-on graphics cards. DON'T mix XBIOS (Setscreen),
BIOS, GEMDOS and VDI text output stuff. This will break on many, many
configuration. There's only one obvious solution. Write an own VT52 emulator.

I expect this savoury character is wishing he never spoke about no FALCONS at the Ce-Bit show . . . . . As we now know it was shown there !
Concerning the Real machine bit - why a Acorn Archemedes A5000. I have never heard of such a computer, the only Acorn I heard of was a little box like object like the Comm**ore 64 and loveable Spectrum 48.

Just because Atari have abandoned a sheep shagging nation does n't mean they have abandoned the rest of the world. ATARI are big in Europe and have Real machines such as the Mega STE's and excellent TT's.
I don't know the spec of a Chestnut or Acorn but I am happy with what ATARI have produced.

Your message should have posted to the Archemedes Fan Club of New Zealand and not the Atari section of Netserver.

'Nuff said,

-Simon

I contacted Atari a few days ago, and the number I used was:

1-408-744-0880

The operator (at Atari) put me through to Gail Bacani, and I found out
some information about the Developer's Package:

1. Credit Card paymenmt is not accepted. They only take checks.

2. From canada, Gail told me no tax had to be payed and the shipping and
handling would be taken care of by Atari (regular US Mail, I guess).

Can anyone who has purchased the kit (or parts of it) verify this?

This is an FAQ. Has anyone yet figured out how to use the parallel port
to transfer files between a Portfolio and an ST? I've gotten some
references to programs on the atari archive, always accompanied by the
caveat thata they don't really work. It seems incredible that Atari
supports the PC but not the ST.

robin@castle.ed.ac.uk (R C Smith) writes ...]

> OK so I am very ignorant, but can someone tell me exactly what SLIP and
> UUCP do, I've sussed they are some kind of comms thing.

UUCP is a system for transferring files between computers running Unix using modems or direct serial links. UUCP stands for ``Unix-Unix CoPy.'' There are UUCP-compatible programs for other operating systems, including TOS. Among the files commonly transferred via UUCP are email and Usenet netnews. UUCP includes a protocol for connecting and negotiating some details of file transfers, plus a family of protocols for performing the actual data transfer. The most commonly used transfer protocol, UUCP 'G', is a windowing system that uses irritatingly small packets.

SLIP is a specification for performing TCP/IP networking over a serial data link. SLIP stands for Serial Link Internet Protocol. (The are other serial link methods; SLIP, SLFP and PPP are the most common.) TCP/IP stands for Transmission Control Protocol/Internet Protocol. TCP is a packetizing data protocol for multiple-access wide-area networking, such as the Internet and packet radio (HAMs on computers). The IP family covers the higher-level protocols for performing common network services, such as mail transfer (SMTP), file transfers (FTP), etc. For more information on TCP/IP and SLIP, see the documentation for the KA9Q Internet package for the Atari ST, which is available from atari.archive.umich.edu. The docs are extensive and serve as an excellent introduction to networking.

Usenet is an information network whose data flows over a number of different data networks. This message will go from my computer to a university site via UUCP, and then will be distributed widely via TCP/IP. At your end it may take a couple of UUCP hops before it reaches the site where you read Usenet messages.

Hey Roger, Atari may very well be dead in New Zealand, but it is rather
stupid to extrapolate this to the entire world, and especially Europe,
where Atari is doing well. Expand your horizons a little.

If you use the unix version of strip, then don't use the alias, however, alias's have priority over commands, so if one does not use the unix strip on a normal basis, then it will not matter. Besides, there is probably a unix command for any alias I choose, which probably does not do what I want anyway.

Ok that's it. Is there anyone besides me on the net who have heard
rumors about NeXT buying shares in Atari and the Falcon being just
a low-end NeXT?
I have heard the rumors apart from this thread, but it does make
some sense...
DSP 56001 as the NeXT, used as sound-chip, just like NeXT. Microphone
input, just like NeXT. 68030 suitable for a low-end NeXT.

If you need pd GDOS fonts and can only get then in hi-rez you should get hold of a GDOS-font editor and convert them to medium. There are several about.

A mono emulator should have no problem with GDOS fonts. The problem you might have is memory as printer fonts can get so large and the emulator is taking up some extra room.

From: bill@mwca.UUCP
Message-ID: <1976@mwca.UUCP>
Source record: 224111

I recently downloaded from GEnie the demo of Home Accounts (written by Ditek(?), newly distributed in the US by ABC Solutions). This seems like quite an impressive package, with nice graphing and reports, and appears to support everything Pha$ar does and then some.

Has anyone used Home Accounts that can give me an impression of it? And even better, if you've used Pha$ar also, how do they compare? Is Home Accounts solid? Any glaring omissions?

Thanks!

3166. GDOS fonts with Gemini

Newsgroup: comp.sys.atari.st
Date: 1992-03-31 18:13:00 UTC
From: b790zbc@utarlg.uta.edu
Message-ID: <31MAR199212131054@utarlg.uta.edu>
Source record: 224113

I've recently set up Gemini 1.21 and I like it quite a bit.
The fonts are cool, but I haven't had much luck with that. Gemini likes
a certain type, non-proportional. Also, Atari GDOS doesn't work with the
fonts that came with Gemini. I tried v1.1. Is there a newer version?

Is there an archive somewhere that has fonts that will work with Gemini?
Also, a font editor would be nice. Unfortunately, I don't think Degas
Elite's converted fonts would work right. Any suggestions or help would
be greatly appreciated!

Please reply via e-mail. B790ZBC@UTARLG.UTA.EDU. Thanks.

Talking about rubish.....

On the press conference of the CeBIT Atari stated they are allmost ready
with the Falcon 030. Developers will get this machine at the end of April.

So, please speaak for your self and not for Atari.

Bert.

I know I'll probably get jumped on for saying this, but why not
just use GEM and put it in a window? (a.k.a. STalker & Rufus) It would
be slower, but who doesn't use some sort of screen accelerator nowadays?

Yes, both were on system 7. Actually, the version of the system software seems
to make no diference to the program (Speedometer 3.0) that we use anyway, it is
smart enough to shut down ALL other tasks while it is functioning. The Classic
II also rated about 15% slower on Monochrome graphics tests than the original
Mac II, even though the Mac II was using a larger screen (640*480) as opposed
to the 512*384 mac Classic screen. Basically, the Classic II is miserably slow
at everything, especially it "feels slow", I mean really, extremely slow...

Makes sense, but they also hiked the price of the LC with the 030 in it... In
addition, the LC with the 030 is about the same speed as with the 020, in fact,
it is slightly SLOWER in some areas, and slightly faster in others, but when
you get right down to the bottom line, it is within 2% or so of being exactly
the same speed.

Hi, can someone please summarize what's going on with the ST computers
and Atari right now. I have have a 1040ST mono system that I use with
Notatator for MIDI sequencing only. I'm thinking about upgrading to
a system with more memory (i.e Mega 2, btw is $475 a good price for a
used one?), but I've overheard that Atari is coming out with a "plus"
line of computers.
What features do they have. What are retail prices and does anyone
know what developer prices are?
If these questions are too boring for the net, I'd appreciate private
e-mail.
Thanks a lot,
-dart

3175. Atari Advantage magazine!

Newsgroup: comp.sys.atari.st
Date: 1992-03-31 23:14:48 UTC
From: "J.J. Lehett" <JJL101@psuvm.psu.edu>
Message-ID: <92091.181449JJL101@psuvm.psu.edu>
Source record: 224122

Got the first issue of Atari Advantage magazine today! For those
who are interested, they are STILL offering an incredible subscription
rate of 12 issues for 11 bucks for pre paid orders. This offer is ONLY
good via mail.
Their address is:

Lamplight Publishing
400 Galice Dr.
Merlin, OR 97532

This offer is only good until April 30th.

As for a very short review of the magazine...

The first and last 8 pages of the of the magazine are printed on
a very bright white medium weight paper. Its 64 pages long this month.
The middle pages are printed on newsprint type paper. It contains the popular
Rumor City from ST Informer (as this mag has staff that formerly were from
ST Informer).
Two major articles are reviews of the 1992 NAMM show and the 1991
Winter CES, detailing the Lynx.
Reviews include Ralph Turners books, Forget-me-clock II, DC Shower, Diamond
Back 2.41, Learning Games Package, Edhak 2.3, and Protext 5.0.
As having just gotten the mag, I would have to say that my first impression
with it is a very positive one. In a brief run through the magazine, it seems
to be chock full of info. As the subtitle of the mag says, 'The Authoritative
Magazine for the Atari ST/STe/TT Computer Systems', it does indeed mainly focus
on the computer line, however as the Lynx article demonstrates, they will
be willing to cover other Atari product lines.

Well, I want to get back to reading the mag, just thought I would let you
all know that it IS a reality now, and to get those subscriptions in.
I'll let a better 'Mag Reviewer' than me take over from here.

PS. I am in no way affilliated with the Atari Advantage.

I have heard the same rumor and wondered the same thing. I posted the
same kind of "tell me what you know" on comp.sys.next.misc and got a
few responses. The general consensus was that it is NOT true. NeXT is
a private corporation trying to go public, and the last thing you do before
going public is incur the debt of buying another company (although Atari has
lots of cash on hand right now).

If the configuration of the Falcon is true, Atari and NeXT would be stupid
not to release NeXTstep on it. The original NeXT cube was a 25MHZ 030 so
there shouldn`t be a speed problem. OS 2.0 sped up the system greatly and
3.0 (due in June) is supposed to be faster yet contain even more goodies! I
think the combo could really fly. (Read: I am too poor to own a NeXT but
really want to. Hey, at least I am honest.)

Atari could give NeXT the low-end (in terms of "workstation" and cost) mass
market they need to compete with SUN/IBM/Apple. NeXT could give Atari a
better aura of respectability. *I* know Atari is a real company, and *you*
know it's a real company, but the DOS/Apple world at large still looks at
it as either a failure or a game machine. NeXT could produce a cheap 030
machine but they are still trying to shed the image that they are slow
neat looking cubes. The new OS is zippier and "slow" performance should
be acceptable if it doesn't spout the "NeXT" label.

NeXT can raise the expections of what a workstation should be able to do and
Atari can raise the expectation of what a home computer should be able to do.
I really think the two of them could put the squeeze on Apple and SUN. Apple
is slowly bringing their prices more in-line with reality but they need a heavy
dose of Falcon-shock to bring them around!

Irregardless, if the price and features of the Falcon are even reasonably
close to what is being said now, I want one. And unlike my NeXT fixation,
I probably will be able to afford one!

Oh well enough raving for now. Sorry to interupt your daily schedule.

From: timg@ncsa.uiuc.edu
Message-ID: <69496@ut-emx.uucp>
Source record: 224124

I just put an updated version of ghostscript 2.3 (2.3.1) on atari.archive, and I expect it to be available soon. It is in a file called gs231b.zoo. Unless Mr. Weiner rearranges the archive, this file contains only the exectable, so you will need the support files contained in gs23b.zoo The following excerpt from the readme file outlines the improvements.

I will make no further changes to GS 2.3, since I will be working on 2.4.

GS 2.3 FOR THE ATARI ST:

GHOSTSCRIPT OVERVIEW: 3/31/92 Revision 1

Ghostscript is the GNU project's postscript language interpreter. It can be used to convert postscript files into formats suitable for non-postscript printers, or to display postscript files on the screen.

This is the first and last revision of GS 2.3, since GS 2.4 has just been released and I will now concentrate on it. 2.4 is supposed to be faster, and font support is improved. This executable contains all the improvements that I made to GS 2.3 but never posted. I thought that people might want to use it while I work on 2.4. There are a few enhancements over the 'zeroth' revision, which I will summarize here for those already familiar with GS.

1.) A new screen device called stvdi is included. This device uses the vdi to determine screen resolution. It is still a MONOCHROME device, but is faster than the stmono device and should work on screens of arbitrary resolution (as long as the vdi reports the proper resolution). It works on at least one TT high res monitor. I must warn anyone using this device that it is a bit unstable, so don't be too upset if you get a couple of bombs every now and then. Because of this instability, stmono is still the default device.

2.) There are two ways to send output directly to the printer. Including '-oPRN:' on the command line will send output to the centronics port via gemdos. The option '-oCEN:' will write output directly to the centronics port. The routines for direct printer output were contributed by Chris Strunk (CS-TeX)--THANKS! Direct centronics output is generally much faster (about a factor of 4 for heavy graphics). The '-o' option apparently doesn't work properly if you put it on the end of a command line, so ....

3.) Band (clist) printing now works. The default is still to print
the entire image in memory, since it is faster. But the option
'-cSIZE' will print the image in bands of SIZE bytes. '-c200000'
prints in 200kbyte bands.

Its much like the things that I read about the New CD Rom and then
when the STE was coming out, it was claimed to be a Amiga killer,
it did not even kill the C64 over here...

I will believe it when I see them in the shops here, but then again we
don't have any Atari shops here any more..

3179. Spectre GCR and accelerator boards

Newsgroup: comp.sys.atari.st
Date: 1992-04-01 03:44:06 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Apr1.034406.8363@watserv1.waterloo.edu>
Source record: 224126
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently saw someone mention they used an accelerator board with Spectre
GCR to get 2-3 times the performance out of it... This may be just what I need.
Which accelerators work with Spectre GCR to give a faster system?
Does the SST? Would the Tiny Turbo 030? How about one of those 25 Mhz 68000
boards?
Also, which memory boards can go up to 4 megs? How easy are they to install,
and how much do they cost? Will both an accelerator & 4 megs fit into my
1040 STFM? Does the version of TOS I have make any difference to Spectre?

Are there any commercial boards to take an old ST over 4 megs?

Could you please elaborate on this? I got Microsoft Write (don't laugh, it was free) a while ago, but it didn't have any of the printer fonts or drivers with it. Where can I get drivers and printer fonts from (for free) if that's at all possible? I believe that you can generate your own printer fonts given the screen font, but you need a font editor to do so.... Where can I get a free font editor from also?

Pat -- have a day!

3181. Falcons, NeXts, Macs, and Reality

Newsgroup: comp.sys.atari.st
Date: 1992-04-01 04:19:04 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <QdqHasa00WCXQ9VUY2@andrew.cmu.edu>
Source record: 224128

Ted Brown makes mention of implementing the NeXTstep software on the (I'll-believe-it-when-I-see-it) Atari Falcon. This would indeed be very cool. That is, IF...

* The Falcon has a 68030 at 25Mhz or better, a math coprocessor, and a NeXT-level graphic display (it doesn't, from what I've heard. And the prototype 80486-based NeXTstep package requires a video board beyond even SVGA standards, and is still being developed.)

* The Falcon will run NeXT stuff in color. NeXT color is incredible, indeed at such a high standard that implementing it on the Falcon would undoubtedly prove too costly.

* Atari and NeXT are actually capable of mutual cooperation. Not bloody likely. NeXT Co. will look down their snooty high-end noses at Atari and sniff "Go away, I find you offensive." And Atari's management would undoubtedly find some way to screw the deal up.

So, I imagine the Falcon, even if a complete 25 Mhz+, 4+Mb RAM, math-coprocessor-equipped, 80+Mb HD, monitor-included system can be had for $2000, will be a failure.

Why?

* It will be incompatible with everything, and no one will want to develop for it.

* '386 and '486 PCs with Windows 3.1 keep getting cheaper. I can get a 40 MHz '386 with Windows 3.1, 130 Mb HD with cache, 4 Mb RAM, 64K RAM cache, 1024*768 SVGA graphics, and an SVGA monitor for under $1800 now. Add in $200 for a good sound card and this thing cooks. Soon, comparable '486sx or even '486dx systems will be at this price.

* Apple will further reduce the prices of the Mac IIsi and IIci models, bringing at least the IIsi down to the $2000-complete-system level.

* It won't be out until 1993, or maybe even 1994.

Eh, what's the use. I'm getting out of the Atari market as soon as I have the bucks. My 1040ST was a good deal in 1987, but nowadays, forget it.

Flames will be ignored, meaningful comments will be responded to.

P.S. It's hysterical watching the Atari diehards get all fired up over something as insubstantial as another Atari prototype. Remember the CD-ROM? I'll believe this thing exists when I see it on the market. In *major* computer stores.

3187. File number limit ?

Newsgroup: comp.sys.atari.st
Date: 1992-04-02 13:49:08 UTC
From: doucet@ripolin.laas.fr
Message-ID: <7252@laas.laas.fr>
Source record: 221896

Yesterday, when grouping fonts collections on one floppy,
the copy stopped with the message "invalid copy operation".
When looking at what have been copied on the floppy, I noticed
it contained 128 files, and had much free space left.
This is a too familiar number to not remark it.

So, the question is:
- is 128 a limit for the number of files that can fit on a floppy ?
- or is this a limit for just one directory ?
- or have I problems with my machine ?

TOS version is 1.62, comp is a 520STE.

Thanks for every information.

It just occurred to me to ask who it was that showed the consumer 68030 box at CEBIT. If it was a corporate officer, the demonstration could be taken as an authoritative statement of where Atari WANTS to go. If the presentation was by a recognized spokesman (right now, I think that means Bob Brodie or Bill Rehbock), it can be interpreted as a product announcement. And if the presentation was by a hardware person, it would be a show-and-tell of what kind of things Atari is working on. Anyone know who did the show?

The only possible reason Jack got into Atari is that he loves running a computer company. And the only imaginable reason he lets his kids play with it is that they love it too. It's like the farmer who won the lottery: when asked whether he'd continue farming now that he had all that money, he answered "I'll keep farming as long as the money holds out". As long as the Tramiels can afford it, I expect them to run a computer company. The way I read the numbers, a lot of Tramiel personal funds went into keeping Atari going after the Federated catastrophe. So they're at least that committed to staying in the game.

Personally,I have been watching this, I dare not call it debate, discussion about Atari's new system. They have not announced anything. All this typing babble is just that, babble. There is no one to confirm or deny these RUMORS. I am an Atari devotee, I own an ORIGINAL 800, 130xe, 1040 ST, and a MEGA ST2. I will wait to see.

Also, over the year, I have come to not trust everything said in Streports. I do not believe everything they say because they get most of ther information from discussions like this. Wait until fall. We will know then, even if we don't own it then...

Message-ID: <1992Apr2.194417.13232@umiami.ir.miami.edu>
Source record: 224142

I have been using Calamus SL for just over 24 hours now and my 2 main complaints.

1. The Printing on my Deskjet 500 is well over 6 times as slow as in version 1.09N

2. Importing files into it is also quite slow. IT takes a great deal of time on a standard ST, I have a MEGA 2, to redraw screens.

Does anyone know if either of these can be remedied? I am waiting on a T25 so the screen refresh will increase, but what about the printing?

Before people get their hopes up, I should note that while the above is an accurate enough overview of our eventual plans, TUG is only going to have the PC and Mac versions of things available in the near future. Atari and Amiga versions will take a little longer, though I have every intention of seeing that they eventually are available also.

Incidently, thank you to all the people who replied to my earlier request for help and background information on TeX for the Atari and Amiga. I've got all your replies stashed on my hard disk waiting for when I've got some other things taken care of.

>(Someone corrent me if I am off base here.) If you have already geared the
>board to run at a certain speed, and the MMU is pennies more, why not use it?

I think maybe I heard wrong - nobody has confirmed that they'd heard
the rumor I wrote about. Sounds more like it will be a _slow_ 68030
(maybe only 16 MHz), and only ST RAM (slow RAM). On the other hand, I
think they look on this machine as an ST replacement, not a low-end
TT, so I don't know.

Hey! Guess what I saw earlier today!? A LYNX COMMERCIAL! And a NEW one at that! (At least to me, over here by San Francisco) It had some of the old scenes like the kid by the brick wall who gets all of the bullet-holes through him, and the 4 kids playing Gauntlet. But they also showed pics (enhanced of course) of some games I've never seen (I'm inthe dark tho. I've HEARD of most of them, but not actually fiddled with them) like Ninja Gai-den and stuff. WAY COOL! :) I wish Nintendo would just give up on their little GameBoy peice of trash. How can one compare 4 colors to 4096!?

Sorta like CrApple// or Timex Sinclair to a SVGA IBM or Amiga or TT or something!!!! hehe >>ATARI SPENDS MONEY USEFULLY FOR ONCE IN A BLUE-MOON!<< happy... sort of.. Bill

NeXT has succeeded in getting an Intel port. By this time next year, there
will be NeXTstep for 486 and 586 computers. In addition, it is widely
speculated that NeXT will release a SPARC port once their own RISC
system is out. They are not going to "join up" with anyone except
some PC makers.

As I have said before, there really is no reason for NeXT to make it's
OS available for the Atari. It's be interesting, but I don't think
we'll see it.

But I still feel that Atari has a good opportunity to get some momentum
back. If they could get these systems out, I'm sure they'll do well
against the competition in Europe. The US here is kinda Mac-happy
at the moment, but they could still make some sales.

3206. Crack Art: ENGLISH! manual

Newsgroup: comp.sys.atari.st
Date: 1992-04-03 04:55:27 UTC
From: cse0507@desire.wright.edu
Message-ID: <1992Apr2.235527.741@desire.wright.edu>
Source record: 223951

I've just uploaded a partial English translation of the CrackArt manual to atari.archive. Dan (our prez) says it's about half there, but most of the graphics stuff is in there. When we (Kervyn) get the rest of the misc. stuff translated, we'll upload a complete manual.
For those who just can't wait for Jon & Co. to put it in the right directory, here's how to get it quick. FTP to a.a, and cd to the atari/new directory...the one you actually upload to, but can't get a directory of. Don't worry about getting a directory, it's there. Set binary file type, and get the file called CRAKENG1.ARC. Works fine for me every time, although it is a little gray. Keep posting those filenames, everybody! :-)
Finally, a little off the SUBJECT: Who know of a good PD multi-window editor? Should be a GEM program, able to take names from argv[], but still be a GEM text editor. EMAIL names, and/or FTP locations.

Yes, it would be very nice if it did. Go GEM.

I haven't been following the discussion too closely...you want a non-moving
status line on the screen, and text to scroll up? Use GEM windows, if you
can. Open a window with no slider/arrows/sizer, just a title (if you want) and
an info line. Use the wind_set call to change the info line to whatever you
want. For that matter, you could have two status lines- there is that
title bar, too. If you need the full 80x24, open it to FULLXYWH. Width
checks are easy, and use the usual method of scrolling text. True, you would
again have to write a VT52 emulator, and use GEM, but it is very compatible
and extends the life of your proggy immeasurably. If you really want to hack
around with resource files, use the menu bar as a status line: there are calls
to change what the menu bar is and what is in it. Then the window needs
no controls at all. I for one don't really mind WHERE the status line is
on the screen, but I DO mind not having GEM.

Nobody ever claimed those things! A guy in Finland just read that
the Falcon '030 machines would be available with 16 to 50 MHZ chips
and be almost as cheap as a Amiga 500/600 with 7 MHZ 68000 and a
monitor!! How much would it cost to get the same stuff as a Falcon
even if Commodore gave you a A600 for FREE???? If you keep
buying the same old Amiga chips then Irv and Mehdi couldn't
care less about making better Amgias!! Just think about
it! The REAL Commodre is now called ATARI.

The Atari Falcon '030 are computers for the home and small business. The Jaguar will be a $200 (about) game machine that is supposed to have a lot of the graphic and CD like sound of the Falcons. Psgnosis is making killer stuff for the Jaguar now that will make most people choose it over the Nintento, SEGA, NEC..

OK, here's my .02 on this. If you use vdi, vgtxt(), and scroll your
screen using vrocpyfm(), you can lift all but the last line of text up
one line and write the new line under it. With any screen accelerator
this is quite fast, as long as you make sure your text strings start
on even boundarys.
There are a bunch of vt52 like commands listed in the vdi, like v_ron()
and v_roff(). I remember hearing a rumour that these don't work, but have
never had the need to try them. Anyone know if the esc vdi stuff works?

>or Bill Rehbock), it can be interpreted as a product announcement. And if
>the presentation was by a hardware person, it would be a show-and-tell of
>what kind of things Atari is working on. Anyone know who did the show?

It was Jack 'The Terminator' Tramiel!!!! Yes the MAN from Commodore
who wiped out the old Atari is back and demoed the Falcon '030s.
When JT does the showing himself you know Atari is serious and
about to unleash something wild. When he stepped aside to
let his sons learn the ropes Commodore definitely went ahead
with the Amigas. Now all Commodore does is keep coming up
with only Amigas and nothing else!! Where is all that
IMAGINATION??! Some guy in Isreal posted the 2.1 update
notes and now everyone knows that the Amiga 500++ will have
only 256 color! Notice that their POWER UP/Rebate has
been going on forever? Amigans can thank Atari for that, since
the A3000 would have to sell very low to compete against
the Falcon '030s.

This site has a vast amount of software for the atari and if the software that you're after is out there then it's more than likely at Michigan.

I have a whole load more sites if you want them but they aren't as big as Michigan.

Anything to change the subject from Ultima Dungeon :-)
I think I'm fairly well qualified to answer this one since I only
recently moved from an Acorn box to a 486/33...

Support for Acorn machines in the U.K. is pretty solid, not as wide as
clone or Amiga, but you can get them in the high street and you ring
local people in yellow pages who'll fix 'em. You can even take
out maintenance contracts and the like. What is interesting from
the perspective of this group is that the installed base (now in the
100's of K boxes) has reached ``critical mass'' for games. As well as
some really quite impressive efforts from specialist houses (4th
Dimension springs to mind) there is now a steady flow of ports of
mid-range Mainstream stuff plus a couple of biggies in the final stages
of pre-release (a big space/exporation game plus a Ulitma Dungeon style
effort).

Even so, I suspect the machine is forever doomed to a niche. The
pace in ISA-land is hotting up so much that the window of opportunity
for specialist architectures is fast closing. A fact aggravated by Acorn's
weird distraction with portable stuff. A real pity as IMHO the Acorn
is probably at least as good as mid-range Amiga's for games:

- The bottom->top end range is small. All machines have either
a ~ 386@25Mhz ARM2 or a ~ 486@25Mhz ARM3 plus Amiga-style stereo
sampled sound and 256 colour video.

- The architecture works well for GFX with the frame buffer held in main
memory and a CPU architecture very well suited to blittery and tight
assembler coding of low-level routines.

I mean if it weren't for the outrageous price/performance of clones
who'd choose VGA and FM synthesised sound to deliver games on!
Certainly, the remarkable quality of some really very low-budget efforts (low

sales price too!) like ``Chocks Away'' or ``Pandora's Box'' suggests the machine makes writing good games pretty painless.

(I still have access to mine - I only sold it on as far as my brother. I thought I'd like to be reminded what games animating 640x256x256 at 25 fps look like from time to time :-( )

Andrew
PS
At present Atari are noticeable for a gradual disappearance of their machines from high-street shop-fronts. Commodore seem to set to dominate that sector of the market.

>... What does "True Color" mean? ...

I believe that the quality of the colour is as good as your eyes will be able
to determine. I think this is 24 bit colour giving 8 bits per RGB primary.

The Falcon is an exciting prospect but I doubt I'll have faith in Atari
until major software vendors like Microsoft,Borland and Aldus create software
for their products or I can pick up a general computer magazine and see
sections dedicated to Atari.

Hello,

a PD-katalog offered fonts and graphics in following formats:
CFN, CVG, PAC. (Just came into my mind, this must be a FAQ.
Sorry, but I haven't seen one for a long time)

I'd be glad to know what programs are they ment for (meaning
do I have to buy an expensive application in order to use them)
and what is their "internal format" (so I could use them in my
programs).

boyd> I'm not sure what you mean. My docs for DCFormatter say quite
boyd> clearly that the button marked "MS-DOS" under the "Bootsector
boyd> Options" menu means exactly what it says.

BEWARE!! DC Format (the shareware version) writes a *DEFAULT* MS-DOS
bootsector forcing tracks to 80 and sectors/track to 9!!

SO WATCH OUT, if your floppy does not have these specs.

Yes, they work. But they useless when you use an environment like the Gemini console window or MultiTOS.

3224. >>> ATARI-ST SOFTWARE SITES <<<

Newsgroup: comp.sys.atari.st
Date: 1992-04-03 14:24:44 UTC
From: woocm@essex.ac.uk
Message-ID: <2806@sersun1.essex.ac.uk>
Source record: 223967

Atari Netters,
Here is the first release, If you can call it that, of
my list of where to find Atari St software. After searching
through some 100 sites looking for atari stuff, here it is.

As you will probably gather this list only contains
sites which have a reasonable amount of atari aoftware on it.
There are many sites which have only a couple of items which
are of either special interest or can just as easily be found
elsewhere. These sites (below) are all IMHO major atari software
sites.

The list is by no means complete and has already been
updated with sites sent from various users in response to my
first request. If you know of a site which is not on this list
or if you spot a mistake, or know of a mail-server for a
particular site (i haven't a clue how to get hold of all those)
then please send an email message to me at,

woocm@essex.ac.uk

with the info. PLEASE DO NOT JUST SEND A MASSIVE LIST
OF SITES UNLESS YOUR SURE THAT THEY ALL HAVE ATARI STUFF. I
would rather not have to waste time searching through sites
that you only use for pc/amiga/unix files only to try and
find atari software that doesn't exist. Thank you.

A copy of this list will be sent to Jeff at
atari.archive for inclusion in the info section.

ENJOY!!

3226. To Dave Small from UK user

Newsgroup: comp.sys.atari.st
Date: 1992-04-03 14:33:31 UTC
From: hrs@aber.ac.uk
Message-ID: <1992Apr3.143331.28159@aber.ac.uk>
Source record: 223969

Having examined in detail the cost of buying a TT I have come to the conclusion that is would be much cheaper for me buy one of Dave Small's SST's and plug it into a second-hand MegaST. Not only would it be cheaper but I would also end up with a faster machine. So what's the problem you might ask, well the company who sells the SST board over here can't seem to get hold of any...I hope Dave Small hasn't stopped making them? What's the latest on SST availability in the USA?

I would be also very interested in any comments on the SST from those you have already bought one?

Duane Davis wrotes:
(oops -- writes!)

You can also buy a 386-25 with 4meg and an 80meg hard drive for about $850.

Yes, but the Mega STE will perform equally well compared to that 386. The
benchmarks in a past Current Notes illustrates that. Atari's hardware
is vastly superior to the more than ten year old IBM clonology.

I don't have that particular issue, if someone does, perhaps they'd like to
post those benchmarks?

You should be able to find TurboCTS in the /telecomm/ directory on atari.archive. If not, let me know and I'll grab it off of GEnie and post it to atari.archive.

Since I'm still using TOS 1.2, I don't need it just yet, as 1.2 is the only TOS where RTS/CTS actually works! ;)

3229. Re: REAL Falcon info/Commodore Peni

Newsgroup: comp.sys.atari.st
Date: 1992-04-03 15:09:02 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1992Apr3.150902.6881@usenet.ins.cwru.edu>
Source record: 223972

According to John Eidsvoog, one of the members of CodeHead
Technology (the Warp 9, Multidesk Deluxe guys), the machine
they saw at CeBit is not to be called 'Falcon.' The specds
on the machine are fairly accurate, but it will have a different
name. The actual Falcon machine will be the 68040 version shown
later this year.

He could give no more details due to nondisclosure agreements.

This info came from the latest GEnie Lamp issue, available on
GEnie.

Re: Commodore Peni

If you ignore them, they'll go away. As long as people respond,
they'll continue with their infantile reactions to their insecurities,
especially with Atari showing great new hardware, and Commode-dore
(two can play at that game) can only show a C-64 version of the
Amiga.

Is there an English translation to the cs-tex document(s)? I just installed the package and have not noticed any and my German is *quite* rusty. Thanks for any help you can give me with this!

wilsont@prism.cs.orst.edu (Timothy E. Wilson) writes:

> I was wondering (with all this talk of falcons and nifty ideas people want)
> if atari staff read the net, and if they do, tell anyother 'higher' staff
> (designers, CEO's etc.) what everone here is wanting etc..

A few months before the ST Book was announced, the guy who (supposedly)
designed it was on a bit. For the most part, he talked about what the
machine would do, said a lot of really inaccurate things about other
notebook computers on the market, and basically projected a "here's how it
is, take it or leave it" attitude.

It wasn't very encouraging. I wonder if there's anything we could do to
encourage the company to pay attention to this forum. I'd think that the
level of technical criticism here and in the tech group would be more useful
to designers than the feedback they get at trade shows and such.

Source record: 223975

I think it's worth commemorating that Roger W. Sheppard has been flamed as a mindless Amiga-basher and a mindless Atari-basher both, here in this very newsgroup, within a single 1-month period. Somehow I feel rather envious of the ease with which he accomplished this extraordinary feat. I'd like to say 'only in America' (for non-US readers: that's a cliche often repeated after either rags-to-riches stories, or examples of monumental stupidity), except very little of this has anything to do with America(s).
Steve saj@chinet.chi.il.us

3233. 32 Pin Socket for Tos 2.06

Newsgroup: comp.sys.atari.st
Date: 1992-04-03 15:34:59 UTC
From: malay@sae.com
Message-ID: <1992Apr3.153459.12302@sae.com>
Source record: 223976

I can't seem to find a source for the IC socket that will work with the new Tos 2.06 chips. Anybody have a mail-order source they can suggest. Radio Shack doesn't carry anything close, my JDR MicroDevices catalog does not list this thing either.

Help?

Bob Malay

>
I'm now in a position to comment about this. I have a Mega 4 ST and a 33MHz 80486 box running pretty regularly. Best graphics on the 80486 box (SVGA) are better, but usual graphics are the same. Disk performance (SCSI vs IDE) seems to favor the ST a little. Even with DOS 5.0 and an extender, memory usage on the Intel box is ridiculous and confusing. Compute-heavy applications (compression, text formatting) run faster on the '486, but not by even a factor of 2. Alas, when it comes to variety and quality of software, there's simply no contest. But the point here is that for applications that DO exist on the ST, with a reasonable mix of activities, that MEGA STE is likely to be a more comfortable machine to use than the 386-25.

I agree that Atari worldwide are a bit lame with the advertising but it does
n't mean their products are lame. The lack of support for the Mega and TT range
is pretty bad especially as they are powerful with the right software.

May be they are waiting for a windfall of cash from Nintendo in their law suit, but that will takes decades . . . . . .

As for the sheep shagging pointers, well I know nothing of sheep but I do know
As for sheep shagging, I don't know any thing about sheep but I know a bit about
sha..

I'd interpret that as meaning that Atari is committed to trying to bring the machine shown, or an equivalent, to market. When the Chairman of the board shows or announces something, it doesn't mean it's ready. I've seen this a lot where I work, in the food industry.

Compaq and Dell were at NeXTWorld Expo. Both companies had hardware
running NeXTStep 3.0. Dell will OEM NeXTStep 486 when it is released.
Compaq has not decided.

>we'll see it.

Atari can lic. the OS. NeXT will lic. their OS.
It would not be a real difficult adaptation.
It would be slow on '030 hardware.

>>cycles waiting for the user to do something. The other info I read on this

As most systems do. Remember unused cpu time is not cumulative though,
so it may be waiting for a while, but when you have a few things running at
once it can get to be a real dog. (At least as far as the cpu's discussed
here, and the slow clock rates go.)

>
>I think maybe I heard wrong - nobody has confirmed that they'd heard
>the rumor I wrote about. Sounds more like it will be a _slow_ 68030
>(maybe only 16 MHz), and only ST RAM (slow RAM). On the other hand, I
>think they look on this machine as an ST replacement, not a low-end
>TT, so I don't know.

I heard 20mhz, which is quite depressing, considering my Sun 3/80,
which is 3 years old now, is also that speed.

Note: this is my first post to this group in years. I was too depressed
to read anymore about the proposed tt which was being gabbed about for
years before anything came about. I sincerely hope that this new machine
doesn't suffer that fate.

CFN usually stands for "Calamus FoNt", CVG for "Calamus Vector Graphic"
(I think you can use this in DIDOT) and PAC for PACked Pixel Graphic (used
for example in STAD, but I don't know how you can get a font out of that).

A friend of mine just bought an ST and wants to use it, along with a keyboard controller to trigger samples. Not your garden variety, use a sample as a patch type of thing, but to do multilayered sound output. Sort of like wall of noise stuff. What we want to know is, what is the best digitizer out there for the money. ST Replay? Digisound pro.? Any other? Also, what is the cheapest, best software to allow the MIDI controller to trigger the smaple bancks. Again, hopefully not just one sample transposed, but a range assigned to different keys or regions, if possible. Is there any PD stuff? Thanks in advance for any info/opinions.

Calamus 1.09N does NOT support Postscript. However, Camamus SL, which I ust aquired through upgrading 2 days ago, WILL. As it is, there is no support for it, but Sl is a module package. Ibn other words, you can load in whatever part of the program you need at one time. Therefore it is always easily upgradable buy purchasing new modules. There are 3 now availabe with another 10 due by the end of summer.

If you need any answers about Calamus, feel free to contact me.

Becoming quite annoyed by this useless bantering, I have a solution. Let the readers here on the Atari boards NOT reply to this child. If we ignore him, this board will return to what we need it to be. That is a fountain of information for the Atari user.
The really sad thing is that I know that all Amiga users are not like this kid. Let us pay him no heed no matter how he tries to lead us on.

Mark Santora

Anyone wishing to make the sysop at this site aware of this user's poor nettiquette can write to postmaster@milton.u.washington.edu or postmaster@u.washington.edu (best to try both just to make sure) and let the sysop know what's going on.

No doubt the system's administrators would be interested in learning about this bandwidth-wasting embarrassment of a user, who reflects poorly on their site and institution.

Three years to shrink a $10,000 machine into a $1,000 machine isn't
really all that bad.

> Note: this is my first post to this group in years. I was too depressed
> to read anymore about the proposed tt which was being gabbed about for
> years before anything came about. I sincerely hope that this new machine
> doesn't suffer that fate.

Well, as we all know from the TT experience, no delay is beyond the realm
of possibility.

But the little-Falcon, sub-Falcon or whatever it winds up being called
shouldn't be as difficult to put together as the TT was. It's really
sounds like a single-board TT with some enhancements (like the DSP). Atari
is pretty good at rejiggering hardware -- anybody who's had to work on
three or more STs knows that they seem to redesign motherboards about once
every six weeks. :-) The new machine(s) shouldn't have to wait for new
software; the problems that arose from converting TOS to run on the '030
have already been solved. I hope that MultiTOS doesn't hold anything up.
I'd much rather have cheap speed now and multitasking GEM later.

It seems to me that every time someone from Atari Corp. makes an
appearance here, the village idiots start throwing tomatoes. I don't know
for a fact that the continual personal abuse, bad manners and juvenile
behavior in comp.sys.atari.st account for the lack of a consistent Atari
Corp. presence here, but I would speculate that it might be a contributing
factor.

There are people on Usenet who are capable of intelligent conversation
about technical matters. Most of them know how to use email.

My opinion about the Falcon is similar, but, as far as the CD-ROM is
concerned, you're wrong.

There's no need for an "Atari CDAR whatsoever". Just go, buy any
SCSI-CD-ROM, get Metados from Atari Corp. and this will do the trick.

Atari cancelled the CDAR 505, because it is cheaper for customers to
buy the Chinon drive instead of the same drive with an Atari sticker
on it.

Cheers, Paddy

I strongly doubt they have stopped making SST boards, they had a long backorder
list from the moment they started shipping and the ads are just now showing
up in US magazines for full availability. Notice the Tiny Turbo 30 is
also now advertising US, but I think their ship date is a bit off, SST has
already been sent out. I think it is rather unlikely that Dave would stop
making the board mere months after completing it, rather we should see an
increasing amount of support and distribution of it.

BTW I am not associated with Gadgets, just watching the market wishing I
could afford one... :-)

>A few months before the ST Book was announced, the guy who (supposedly)
>designed it was on a bit. For the most part, he talked about what the
>machine would do, said a lot of really inaccurate things about other
>notebook computers on the market, and basically projected a "here's how it
>is, take it or leave it" attitude.

Hmm... the way I remember it, T R Hall (who according to Atari
Explorer *did* design the ST Book) had posted the specs of the ST Book
by net request only to get flamed because it wasn't the design didn't
deliver everything that the requester had wanted.

Then T R Hall, in a very informative (IMHO) message, justified the
design decisions explaining the trade offs made due to power
consumption and/or cost (I believe, the two main factors that limit
any notebook computer) as well as the ST Book's good points. From
there, the thread led on to (yet another, but minor this time) flame
war, which was too bad because I found the description of the design
process very interesting.

>I wonder if there's anything we could do to
>encourage the company to pay attention to this forum.

How about if we treat them nicer if they ever decided to return to
this newsgroup? It seems that everytime one of them (such as Ken B.,
Allan Pratt or T R Hall) decides to show up on comp.sys.atari.st or
comp.sys.atari.st.tech someone decides to vent his anger on that
person from Atari.

None of them deserve this. If any of them come, it is on their own
time and not as official representatives of Atari. It is not something
they are duty bound to do. To flame them when they come is rude and
counterproductive. I have never seen them act like anything but
perfect citizens of the net. If you have something to get off your
chest about Atari, it would be much more constructive if you used
conventional mail rather than the net or e-mail.

(ok, ok, I'll stop being preachy now! :-))

3257. TOS Compatibility ST vs. STE

Newsgroup: comp.sys.atari.st
Date: 1992-04-03 21:04:17 UTC
From: rost@rgb.dec.com
Message-ID: <1992Apr3.211244.3992@ryn.mro4.dec.com>
Source record: 224000

I guess this is something of a FAQ in here, bit I have to ask
anyway...apologies n advance.

I have two STs, both running TOS 1.0, and am thinking of upgrading one to an
STE, perhaps a Mega STE. I've heard lots about incompatibilities between the
STE TOS and 1.0. I'm running a lot of older and PD stuff which seems to me to
be highly suspect. I would be hesitant to upgrade if lots of my old programs
would be useless.

In particular:

1st Word (NOT Plus)
1W2PS (PD, coverts 1st Word files to PostScript format)
Dr. T's ESQapade (Patch editor)
Phasar V3.0
Master Tracks Pro V3 (MIDI sequencer)
OSS Personal Pascal V1
D.A. Brumleve's Kidprogs (PD)
Degas Elite
Neochrome Master

If anyone has had experience pro or con on these programs with an STE, please
let me know via E-mail.

Source record: 224001

Another FAQ, I guess, sorry....

How compatible with Mac software is the GCR? I'm concerned that the Mac SW thing is a moving target these days, what is the Mac configuration that GCR emulates? Since the Mac ROMs are in the GCR, does this leave *all*of the ST RAM free for use (unlike, say, PC Ditto which ate up a few hundred Kbytes)? Is software included to deal with the differences between an Imagewriter and an Epson 9-pin?

3259. Need stuff My other question is regarding C compilers. I have just begun learning that language, but the only way I can use it is on my father's IBM. If there are any good (or not so good) compilers availabe for STs in the PD, they would do much to cleanse my conscience (IBM has too much market share already).

BTW, in case you didn't know, the IDE support is for the drives being
put in the new Atari Books. (I saw one the other day - looks good, but the
lack of internal drive bummed me out - even if it does last 12 hours. The
vector pad looked neat tho). I believe I remember asking about Atari
supporting IDE on the desktop computers and the answer was a big no. Besides,
why would you want to limit yourself to only 2 devices on your drive/device
port? With the SCSI you have a 7 device minimum (14 with the TTs extra ACSI
port). You don't get any serious speed increase over SCSI (although it would
be nice if newer Atari's had SCSI2 capability). You might save $10 in
purchasing your drive but is that worth crippling a system?

Wow, I guess I _am_ a beginner. The previous message was my first posting to any newsgroup at all, so here's my second try.

I'm looking for two thing: A C compiler (PD preferably) and a terminal emulator (also PD if possible). I am currently using an early version of Flash that doesn't seem to support any kind of terminal emulation. It's frustrating, as I have to use the "dumb" terminal which, as you know if you've had to use it, is a royal pain in the vi editor. Anyway, if anyone has info on either of these, it would be much appreciated. Keep in mind, please, that I'm a poor student who can't shell out for a big-time commercial product :)

Thanks,

-Aaron

This is an incredible discussion. Let me add something of a question for our best dectives. I have no information, but I just read a pice in the April ST Informer about the ne peripherals for Atari from Peripherals Land, Inc. This had been mentioned in earlier Cebit reports. What was interesting is that the PLI spokesman is quoted as saying:

"We are presently at CeBit in the Atari booth showing our
new poducts, which we intend to release immediately. They are
all designed to integrate with the new series of Atari computers,
and are cast in the new black color."

Question:
Can someone who knows more about these peripherals deduce anything
about the upcoming series of Atari computers?

By the way the peripherals are:

Infinity OPtical drive
Infinity 44 x 88 Syquest Units
CD-Rom (as soon as possible)
it sounds like they may have shown other things.

I have a ICD 30meg drive (seagate ST138N) bought from Toad in 1989.
The drive has not been used that much, maybe 2h every few days.
Since last Monday it seems to slow down every 10-20 min, then comes
up to speed again. A message shows on screen: "<MSense: $FF>".
Is the drive dying? power supply?

Please help!!

Adam

GEM-View + GIFs

Jukebox + Noisetracker mods

I showed these at my lame local dealer who has NOTHING for the TT and they
were quite impressed. You should also try to get the Calamus SL demo. For
speed (TT RAM), try ARC and LZH programs.

I too have noticed this, although I haven't seen the price that low. What's nice is that they're making it more feasible to choose your own drive, since the hard drive kit is apparently more readily available.

I have heard conflicting reports, however, on the availability of the 1.44meg drive upgrades. I want one, but can't find them; one of my local dealers says that they're not available yet, but I've heard of people installing them. I don't think the FPU upgrade kits are readily available yet either.

3271. GFA Basic 2.0 EXEC command

Newsgroup: comp.sys.atari.st
Date: 1992-04-04 02:44:00 UTC
From: b790zbc@utarlg.uta.edu
Message-ID: <3APR199220444024@utarlg.uta.edu>
Source record: 224014

I've been having a bit of trouble with the EXEC command from GFA Basic 2.0.
The manual says the input is EXEC flg,nam,cmd,env where flg=0 load and run,
or flg=3 just load. nam is the string that holds the name of the program to
run. cmd is the command line (this is the problem) and env is the environment.
The manual states that if cmd is not going to be empty i.e. "", the
(cmd is C$) format is Chr$(Len(C$)) + C$ + Chr$(0). I can't get that to work.
If someone has an example, or could point me to one, I would appreciate it.
Thanks.

> and, if so, could anyone here point me towards a source for such a product?

KEvin, if you format your 3.5" disks in the PS/2 in 720k format you can
use them straight away in your 1040ST without any problem.

DC's (Double Click) have a PD software utility to do this with pre
TOS 1.4 machines called DCFORMAT. This will allow you to format in true
IBM format on the ST. If you have TOS 1.4 or greater and you format
with the desktop option it is 100% IBM format.

Hope this helps..

Thomas,

I really am at a loss to what drove you to post such an article to
this news group? Surely this would be better served in email (as this
reply maybe as well).

Surely the interchange of ideas no matter how big,small,gripe,complaint
or compliment about our belovered Atari machines is what this news group
is all about.

While some countries may enjoy continued support for the ST/TT series
(an 8bit) machine Roger has voiced valid complaints about the status
of Atari in New Zealand, and at the end of the day this is what this
news group is all about me old tea towel !

I hope you will retract your personal attack at this chap as it does
not benefit anyone for you to do this leaste of all the readers of
this news group who in times such as this should be united in global
support not infighting (maybe it is that time of year with the
PRIMARIES and all (grin))

Frankly I found it a little un called for to say the leaste and except
your apology in the manner in which it was given.

Although the inference that Atari may have been less than active in the
antipodies we the users are still very PRO-atari and support it where
we humanly can ie this BBS and more.

Stephen Jacobs writes:

>The only possible reason Jack got into Atari is that he loves running a
>computer company. And the only imaginable reason he lets his kids play with
>it is that they love it too.

Um... I dunno about that... it wasn't all that long ago that Jack Tramiel
was quoted as saying something like: "I'm not in business to make
computers, I'm in business to make money."

That was during the time Atari was considering bringing out a line of
"consumer electronics" TVs, microwaves, toasters... etc.

If someone loved running a computer company, why would they have made
such a world-wide mess of it..?

On the other hand, the personal abuse, bad manners, and juvenile behaviour of those revered "Atari representatives" just might have something to do with their reception at times...

Simply because you can sign your messages with " @Atari " doesn't in my opinion confer sainthood on ANYONE...

NO, they're not responsible for the mess Atari is in, but they do seem to be able to make their own messes...

This network IS a good arena to get feedback from a lot of people who want to see the computers improved. It goes both ways.

From: Pierre_Hansen@mz.maus.de
Message-ID: <A7578@MZ.maus.de>
Source record: 224023

E>Does Calamus or Calamus SL print PostScript ? If not is there a utility
E>to convert CDK to PostScript ? Before I spend money on Calamus I want
Neither CALAMUS nor SL print PostScript. However there is a module for SL which
saves CALAMUS-pages in PostScript format. Since this is not the internal
format, you will loose some of the CALAMUS-WYSIWYG quality.

Regards Pierre

Try choping up 2, 24 pin ones, also I have used 2, 24 pin ones for a 48 pin
socket, the USA AMP Diplomat version is a good cheap brand..
